Increase of power and torque

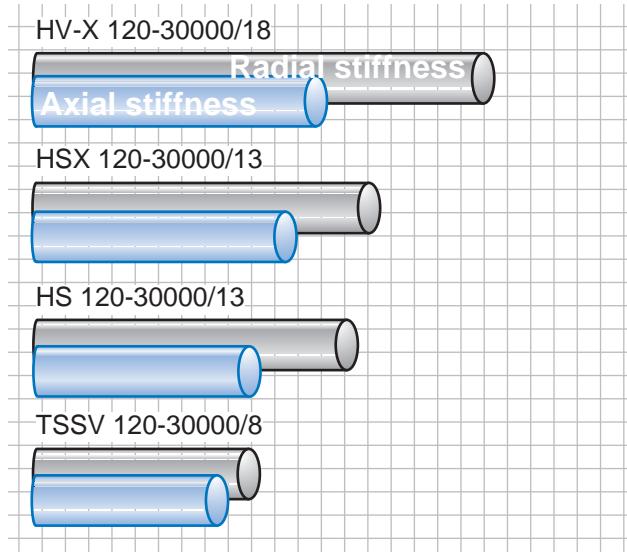

Power, torque and stiffness have been constantly increased as the tables indicate. In addition, reliability, load carrying capacity and working life were also improved. The working life of HSX-spindles in comparison to the HS-spindles is on average 3 times longer.

Economical

The Development

Improvement of the axial and radial stiffness

Selection

With the improvements of power, load carrying capacity and stiffness in the **HV-X** designs the working range of single spindles is extended over the previous models. These enhancements minimize the number of spindles required to cover a large speed range. The special motor design also permits the use of more economically sized frequency converters to match the application requirements.

Tradition

The GMN product line covers a vast range of speeds, output powers, load capacities and options to meet or exceed all application requirements.

GMN strives to provide its customers with the latest advances and technology in spindle design and concepts. With our "**Customer First**" mentality we will continue to manufacture our traditional style spindles, components and provide service and support for the older models and designs.

Advantages Of Hybrid Ceramic Bearings

GMN high frequency spindles utilize hybrid ceramic ball bearings. These bearings have standard steel bearing races and are matched with silicon nitride balls. Advantages of hybrid bearings compared with normal spindle bearings are:

Reduced wear

The high degree of hardness of the balls, and the nongalling effect of the silicon nitride against metallic material lessens the wear. This is especially important in cases of minimal lubrication. In addition, wear particles will not embed themselves into the balls to further damage the races.

Rigidity

Modulus of elasticity is greater than steel, which increases the static and dynamic stiffness. The increase in dynamic rigidity depends on the ratio of bearing preload to the centrifugal force on the balls.

Friction

Because of the reduced spin-rolls ratios and lower Hertian stresses, friction and respectively operating temperatures are reduced.

Axial shaft movement

As a result of the lightweight ceramic balls, centrifugal forces are reduced with a corresponding reduction in dynamic movement of bearing races. In addition, movements due to less friction and the lower coefficient of expansion of ceramics are reduced.

Reliability of operation

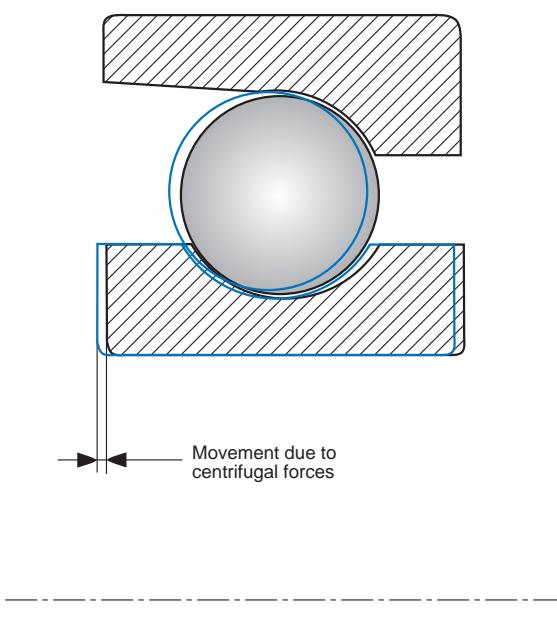

The low thermal coefficient of expansion of the ceramic balls lessens the reduction of the radial running fits in the bearings. These fits are less variable at higher temperature differentials between races.

Vibrations

Radial forces and the moments acting on the bearings produce displacement between the balls and the retainer. Hybrid bearings reduce this effect and produce a positive influence on cage vibrations and stresses.

Accuracy

High frequency spindles are fitted with bearings produced according to GMN standard grade UP. They are distinguished from international standards due to excellent running accuracy.

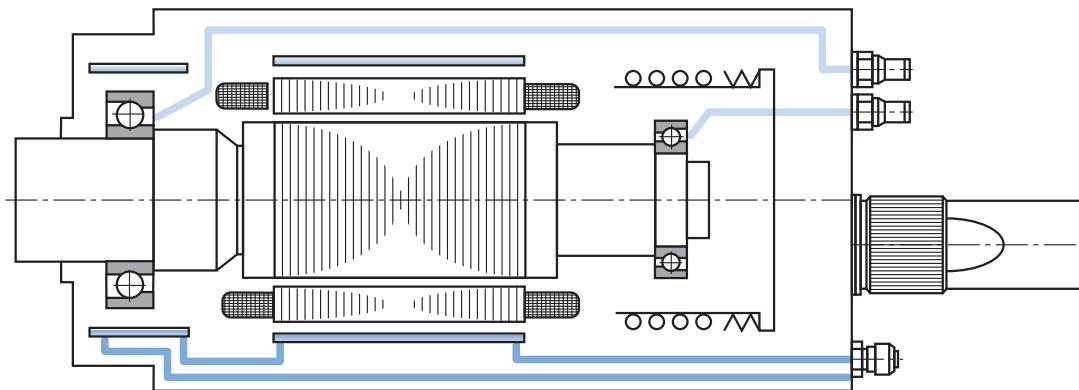

Radial runout of assembled bearing inner ring.
Limits in micron [μm]

Bearing bore diameter [mm]	P4/ABEC 7	Tolerance class P2/ABEC 9	UP
> 2.5...10	2.5	1.5	1.5

> 80....120	6.0	5.0	3.0

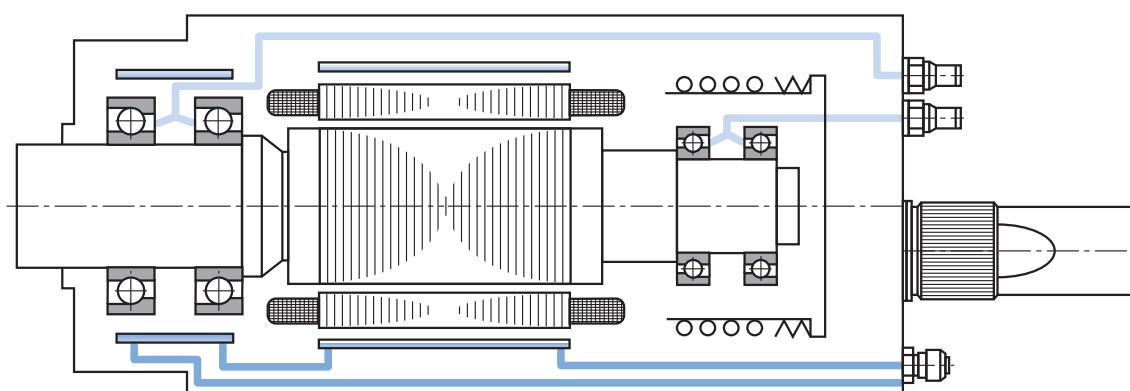

Spring preloaded single bearings

HS 80c - 180000/0.4
HS 80c - 150000/0.5

HS 80c - 120000/1.1
HS 80c - 90000/2

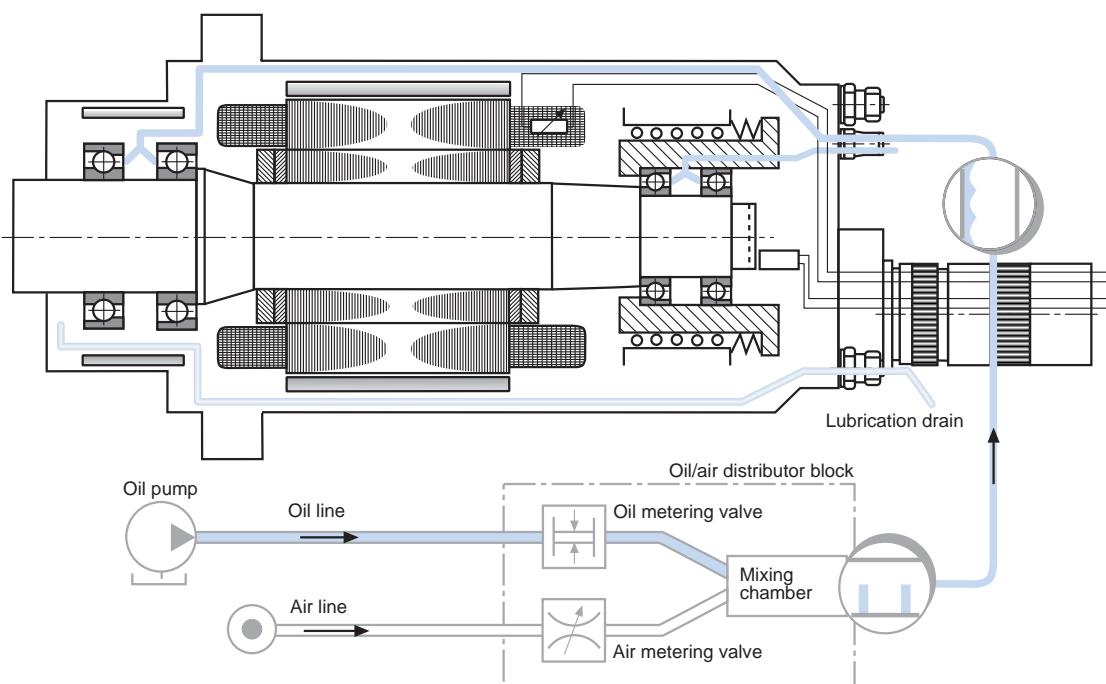

Spring preloaded bearing sets

all other spindles

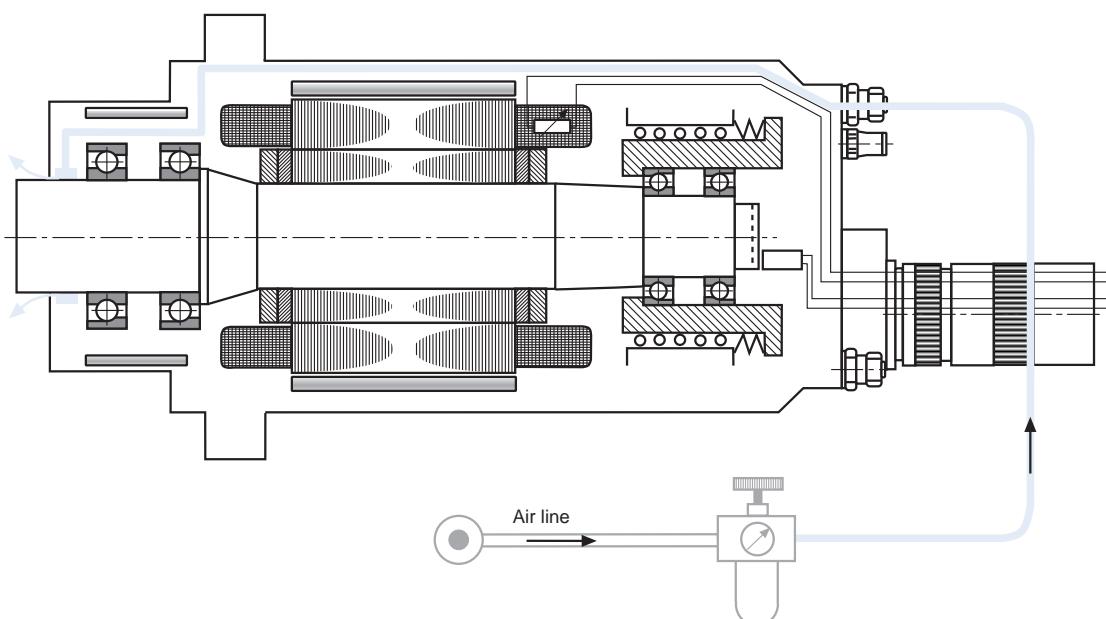

- > Short, rigid construction due to the high-frequency motor being placed between the bearing sets, results in favorable critical speeds, far exceeding the operating speed.
- > High stiffness and load carrying capacities.
- > Low vibration levels due to ultra precision bearings.
- > Minimal temperature variations due to liquid cooling of the motor and front bearings complement.
- > All mounting and critical datums are hardened and ground for longer service life.
- > Monitoring of motor temperature via temperature sensors.

Oil/air lubrication

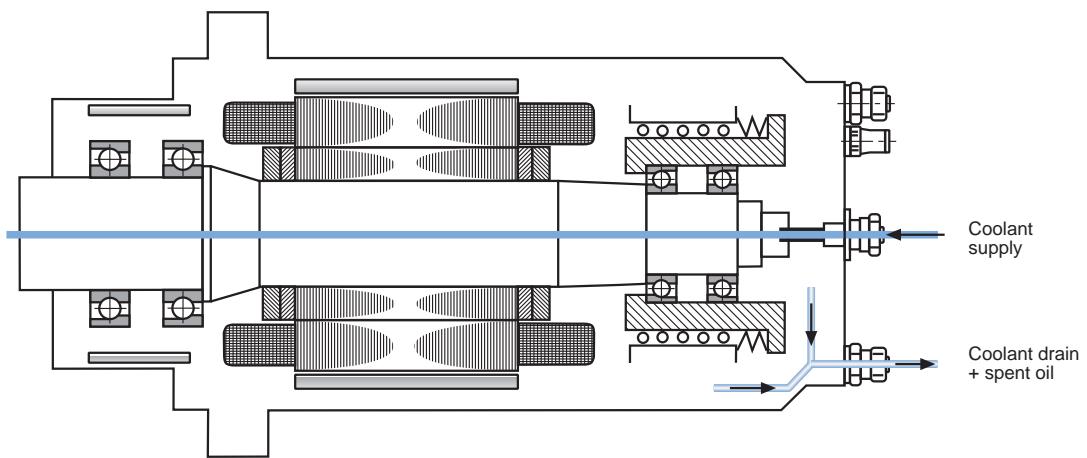

- > High reliability in operation due to separate supply to each bearing group and exact quantity of volume.
- > Ecological compatibility because of minimum oil consumption and elimination of oil mist.
- > Long life and high load carrying capacity as a result of the use of oils with additives like EP and HT.
- > Large spectrum of applicable oils.

Grease lubrication + air purge

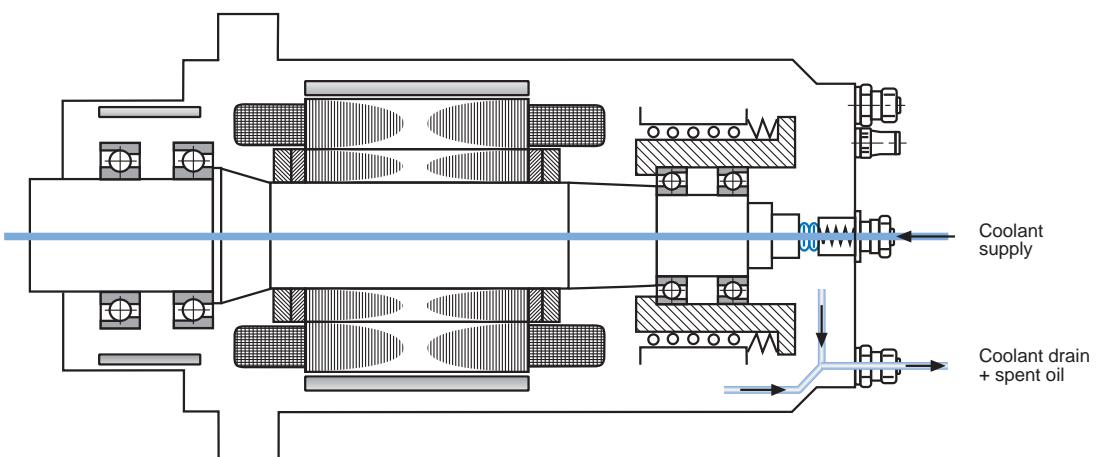

Coolant through the shaft with gap seal (du)

- > Maximum coolant pressure: 4 bar
- > Can be operated dry
- > Horizontal spindle mounting

- > Withstands pressure pulses
- > Coolant filtration: ≤ 0.1 mm

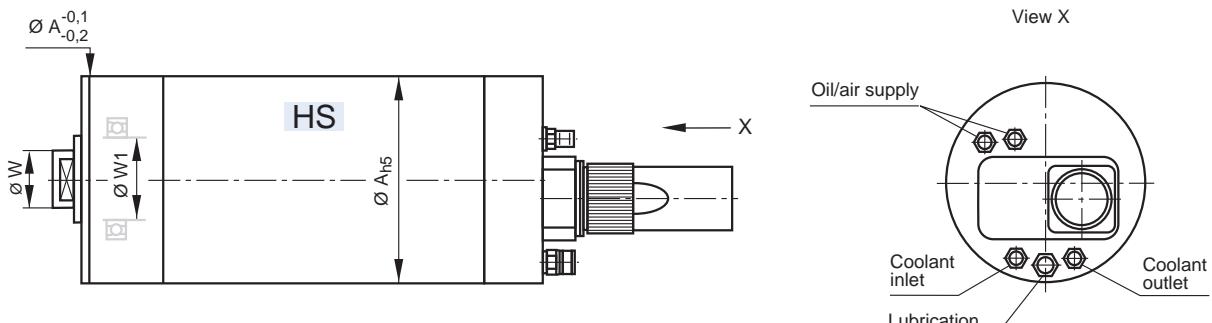

Coolant through the shaft with high pressure rotary union (dh)

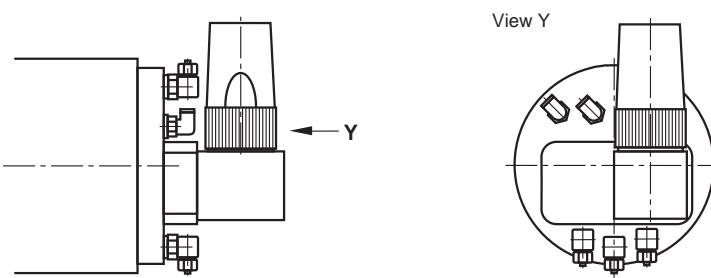

- > Maximum coolant pressure depends on the spindle type and seal design.
Please consult GMN.
- > Minimum coolant pressure: 0.5 bar

- > Can be operated dry
- > Horizontal spindle mounting
- > Pressure pulsing must be avoided
- > Coolant filtration: ≤ 0.01 mm

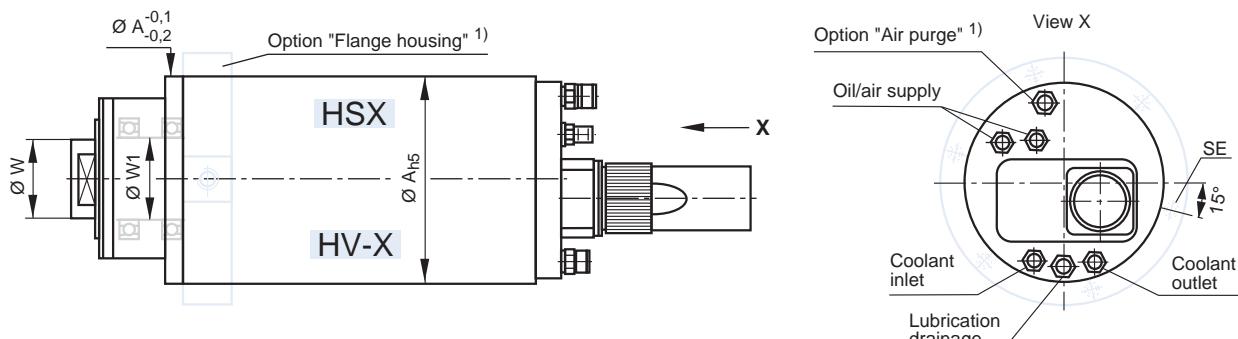

On request, horizontal spindle mounting for both options

Chip removal processes are defined by the material being processed, tool sizes and recommended cutting speeds.

Small diameter tooling requires high speeds, while large diameter cutters need high torque at lower speeds.

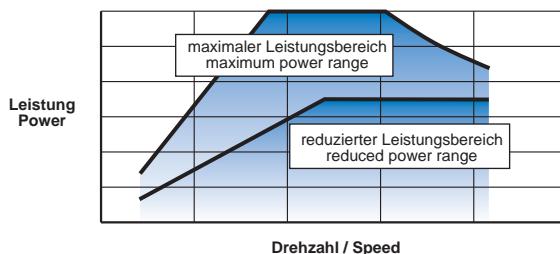

The "field weakening" characteristics offer high torque at low speeds and are also capable of high spindle speeds utilizing the same spindle.

Rigidity required for the volume of material to be removed and also provide a quality finish, this demands larger shaft diameters, thereby spindles become, which allows for longer and more powerful motors.

Because of progress in the development of motors, the power density has been increased to such an extent that, in many cases, the power which can be produced from these proportions is not needed for processing.

On the other hand, oversized systems cause increased costs because of the size of the frequency converter which are required.

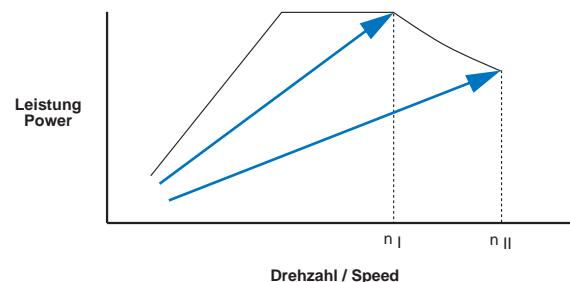

Power

Therefore the spindles can be operated with smaller converters at different levels. The capacity of the converter determines the power profile.

The output power of the motor is produced via the converter being programmed to the proper volts/frequency [v/f] ratio specified in the instruction manual or test report of spindle.

Operation with reduced output power up to various speeds

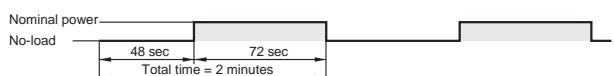

Costs of frequency converters can be reduced by accepting the decreased output power and possibly lower frequency.

Operation mode S1 and S6-60%

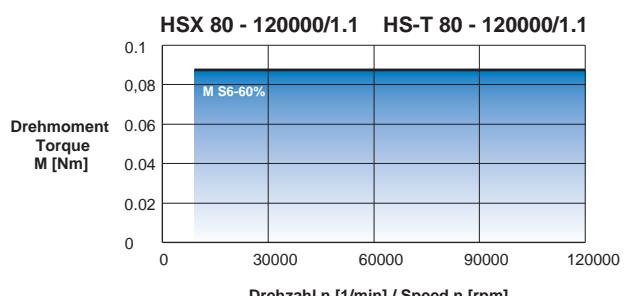

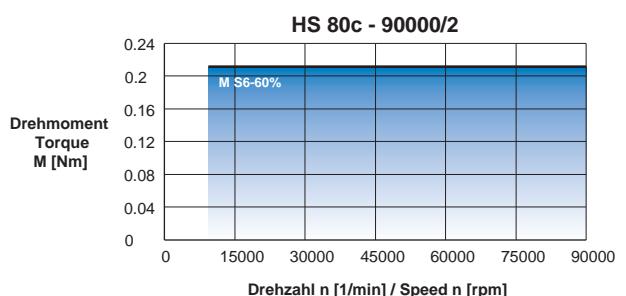

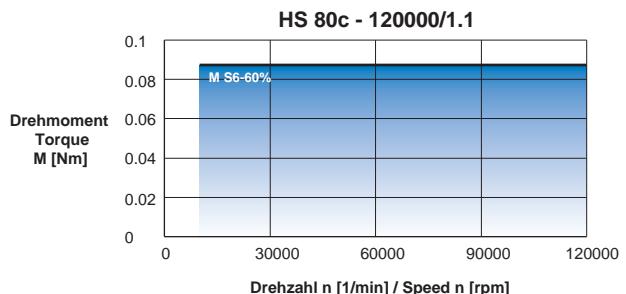

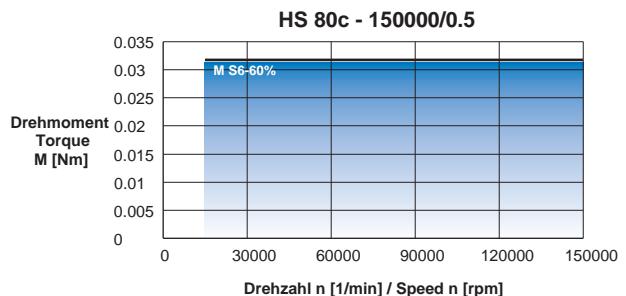

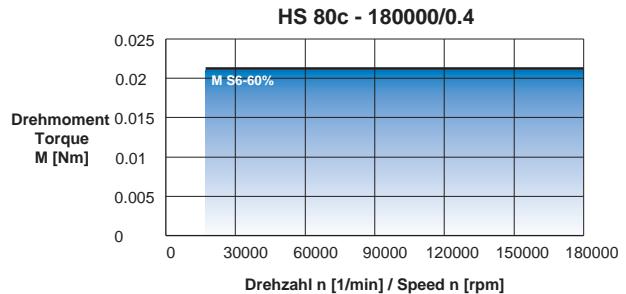

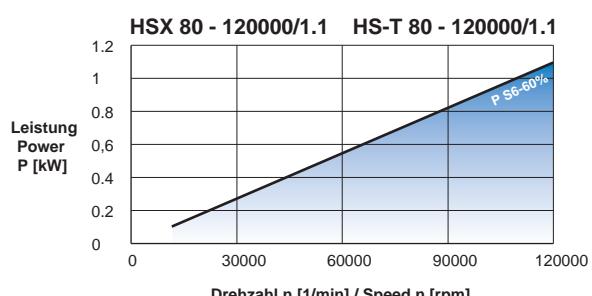

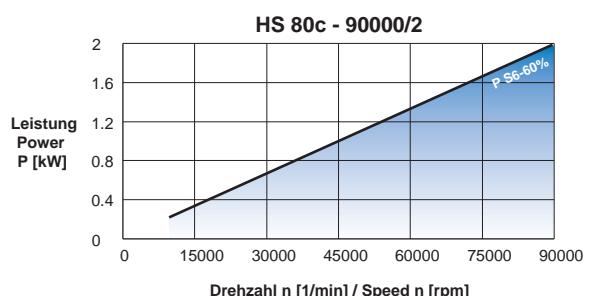

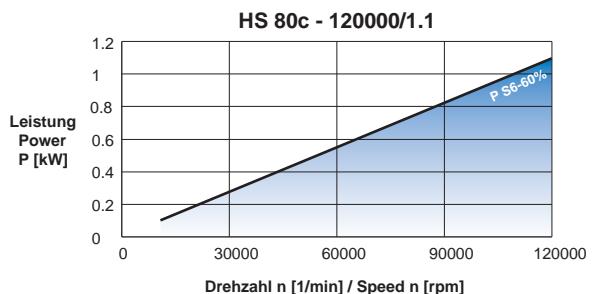

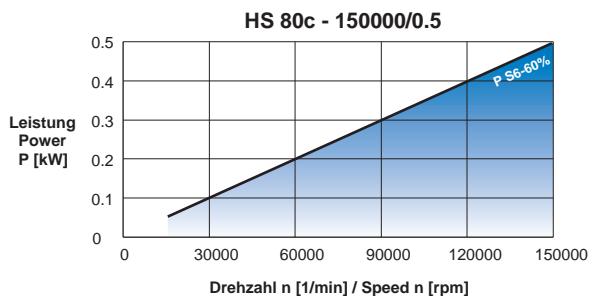

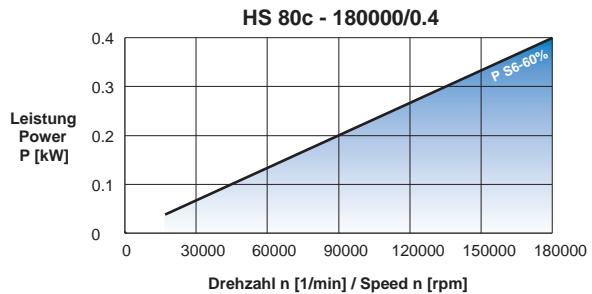

Operation mode S1

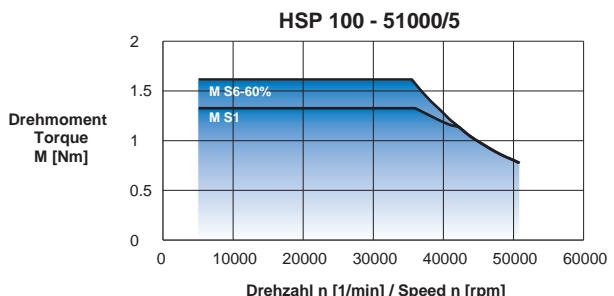

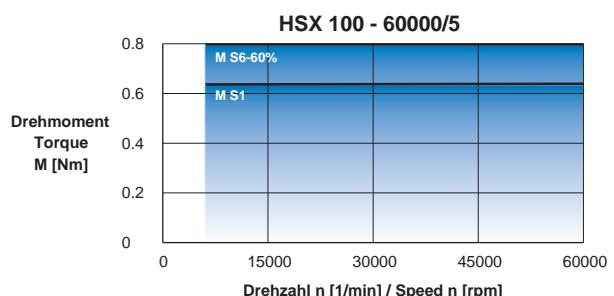

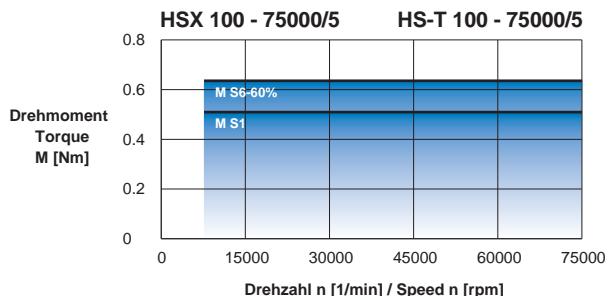

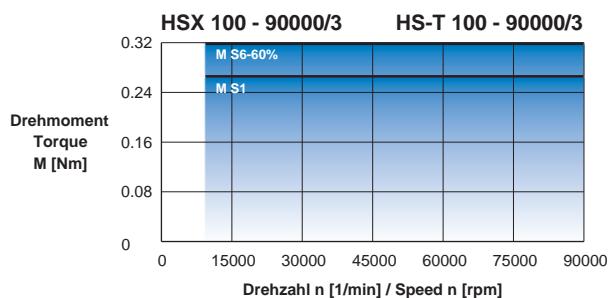

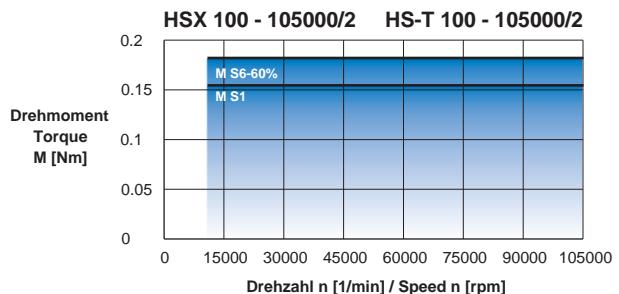

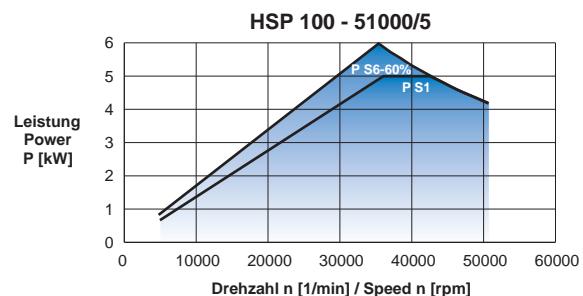

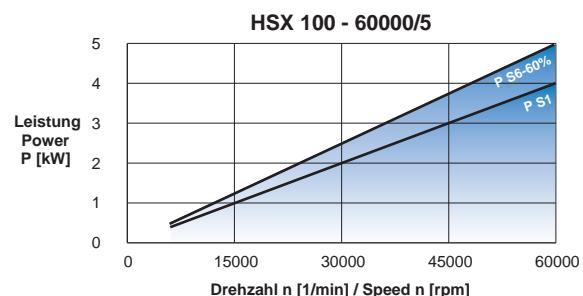

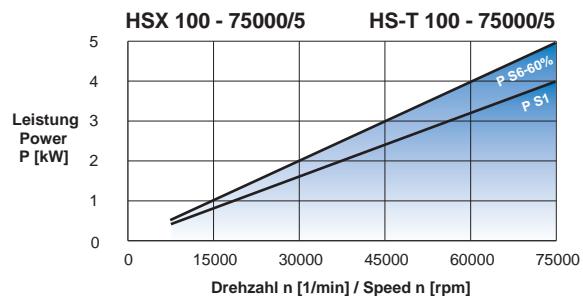

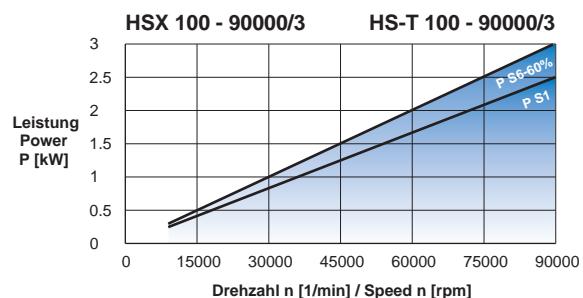

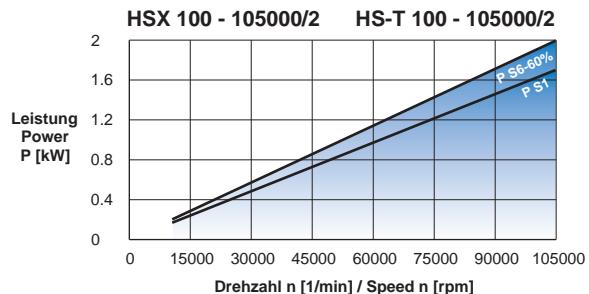

Operation mode S6-60%

Frequency converter with Volts/Hertz characteristics

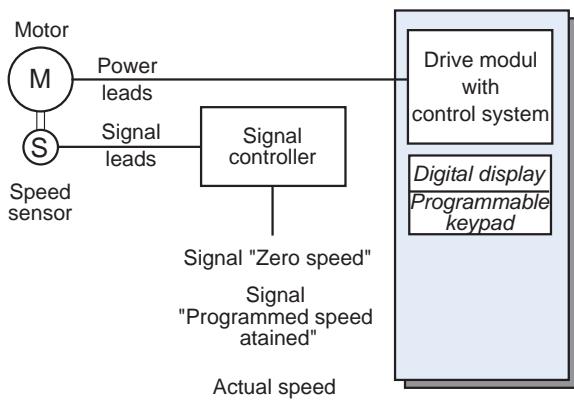

- > Output frequency's to 3000 Hertz¹⁾
- > Operating range 1 : 10
- > Acceleration/deceleration times within 10 seconds
- > Motor temperature monitoring
- > Multiple spindle operation
- > Option card for monitoring exact shaft speed and "Zero speed"
- > Option card for "Gap elimination" and "Load monitoring"

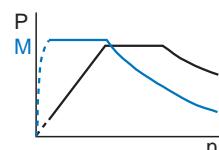

Typical power torque curve in relation to speed.

Vector control without encoder feedback

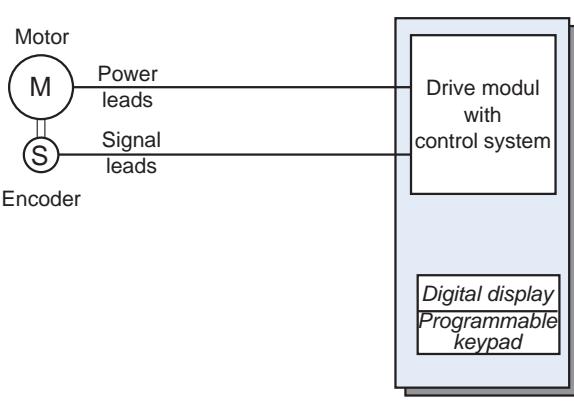

- > Output frequency's to 1400 Hertz¹⁾
- > Operating range 1 : 10 speed regulation approximately 0.5%
- > Vector controlled speed drive
- > Acceleration/deceleration within 1 second

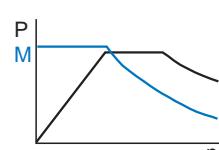

Typical power torque curve in relation to speed.

Vector control with encoder feedback

- > Output frequency's to 1400 Hz¹⁾
- > Shaft orientation
- > Acceleration/deceleration within 1 second

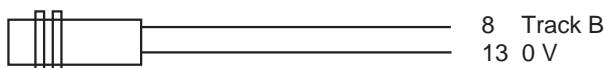

Typical power torque curve in relation to speed.
Full motor torque over the entire speed range without speed fluctuation.

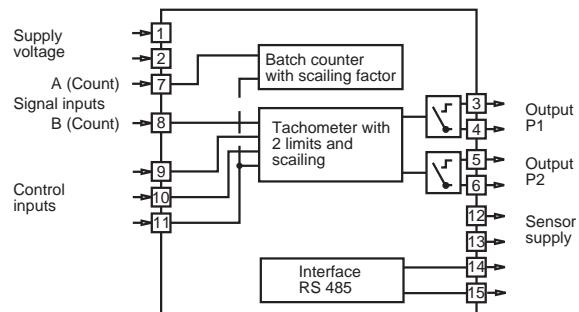

1) Depending on the inverter producer some different maximum output frequency's are possible.

Tachometer TA 134

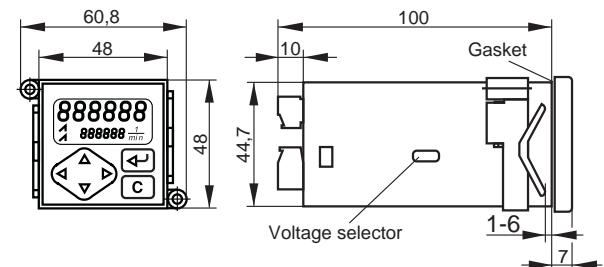

For automated processing equipment an active signalling system is required, signalling when the processing spindle has stopped, e. g. for changing tools or protective functions.
For this purpose a speed sensor in the spindle is required and an amplifier for signal analysis.

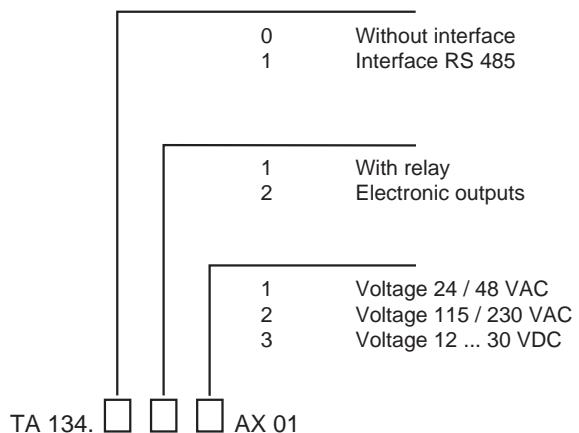

NAMUR without explosion protection

Assignment

Contact	Function
1	Supply voltage
2	Supply voltage
3	Output P1
4	Output P1
5	Output P2
6	Output P2
7	Signal input A (Count)
8	Signal input B (Count)
9	Control input 1 (Tacho)
10	Control input 2 (Programming disabled)
11	Control input 3 (Batch counter Reset)
12	Encoder supply +10 ... 26 V
13	Encoder supply 0 V
14	Option RS 485 (T,R-)
15	Option RS 485 (T;R+)

Display	7-segment LCD-display (TN) with background light On two lines
Digit size	Display of tachometer display: 7 mm Display of limit value: 4 mm „1/min“ „1/s“ „1/h“
Display of measuring unit	Illustration as normally open or normally closed
Display of switching outputs P1, P2	
Supply voltage	As ordered
Power consumption	5 VA, 4 W
Encoder supply	10 ... 26 VDC, 60 mA
Counting rate - Tachometer	25 Hz or 40 kHz
Counting rate - Batch counter	3 Hz, 25 Hz, 10 kHz
Data storage	> 10 years (via EEPROM)
Fixing	Clamping frame
Front measures	48 x 48 mm, casing for front plate installation
Mounting depth	100 mm
Connections	Two plug-in screw terminals With 6 poles (grid 5,08 mm) and with 9 poles (grid 3,81 mm) Max. 1,5 mm ²
Core cross-section	
Casing material	Makrolon 6485
Keypad	Short-stroke keys and front membrane
Front membrane	Polyester membrane
Weight	AC-model: 260 g DC-model: 140 g
Ambient temperature	0 ... +50 °C
Storage temperature	-20 ... +70 °C
Humidity	Max. relative humidity 80%, non-condensing
Protection according to DIN 40050	From the front, in built-in state with seal IP65
Operational requirements	According to contamination factor 2
General rating	EN 61010
Protection category	According to EN 61010 Protection category II
Ovvoltage category	According to EN 61010 Protection category II
Interference immunity	According to EN 50082-2 Severity grade 2-3
Emitted interference	According to EN 50081-2

1) The maximum output voltage of the inverter is limited by the input voltage.

2) Max. 60 s.

3) With dynamic braking 100 mm higher.

Available options which are also spindle dependant.

- Gap eliminator*
- Dynamic braking
- Digital display
- Speed controller

All applicable electrical standards and codes together with manufacturers recommendations and instructions must be adhered to.

All converters supplied by GMN are programmed and interfaced to the applicable spindle.

* Integrated at RS 51.

In order to obtain the legal electromagnetic compatibility the cable length has to be limited.
The applicable recommendations have to be met during designing and setting into operation.

Unbalanced state

Every spindle shaft and every tool incorporates a degree of unbalance, which causes sinuous vibration during rotation. To reduce the effect of unbalancing forces, the unbalancing mass of all rotating parts has to be limited. Shafts of GMN high frequency spindles are always balanced.

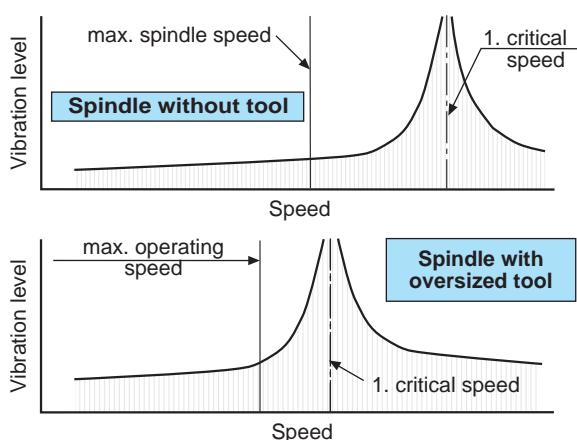

As a result of higher cutting speeds this process is also required for tools.

We recommend for precision cutting a permissible residual unbalance for tools according to the following diagram:

Critical speed

GMN high frequency spindles are designed so that the critical speeds remain above the maximum speed. When using inappropriate tooling the critical speed can be decreased to a level within the operating speed range. This can lead to poor part quality, decreased spindle performance, as well as jeopardizing the safety of the operator and machine.

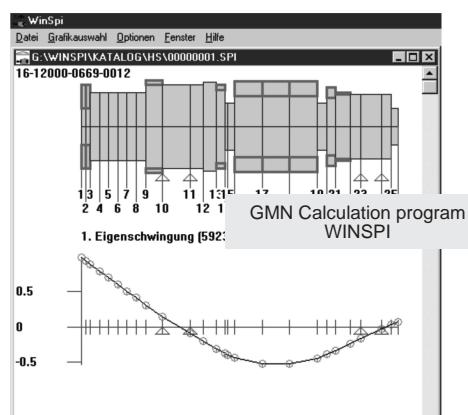

Safety Aspects For Tool Selection

We recommend consulting our application engineering staff when tools which are extremely long and heavy are to be used.

Let GMN analyses your spindle and tooling requirements with our specifically designed computer software.

In addition to the critical frequencies the static and dynamic stiffness and load carrying capacity of each single bearing can be calculated.

Through proper analysis the correct spindle can be selected or tips for improvement of tools can be made.

Centrifugal forces acting on tools

Centrifugal forces created by high rotating speed not only act as unbalancing forces but also induce stress into the tool. Especially inserted tooth milling cutter are very dangerous. When the attachment fails, indexable inserts can fly away like projectiles.

Vibration monitoring

Vibration monitoring equipment can lessen the risk of damage to both the spindle and machine, and also help prevent personnel injury by early detection of wear and looseness in both the spindle and tooling.

When selecting and installing monitoring equipment it should be noted that vibration from the machine and related components must be filtered out or ignored, so as to prevent unnecessary shut down of the machine.

Shrink Fit Tool Holders

High speed machining requires tooling which is rigid, accurate, balanced and also economical. Shrink fit type tool holder systems have been used successfully in high production machining centers applications with HSK and Milling Machine Tapers. As a result of proven advantages of the shrink fit method, GMN has developed a manual change style holder design.

Ordering information: **Shrink fit holder d / W x 3**

Ex. HSX 100-75000/5: d (10) / W (18) x 3.

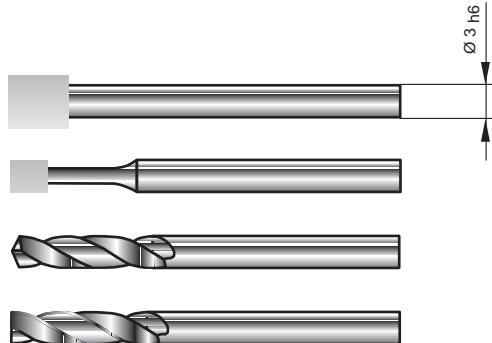

The „3“ indicates the clamping diameter. The standard and smallest clamping diameter is 3 mm. Larger diameters are available upon request.

Clamping method

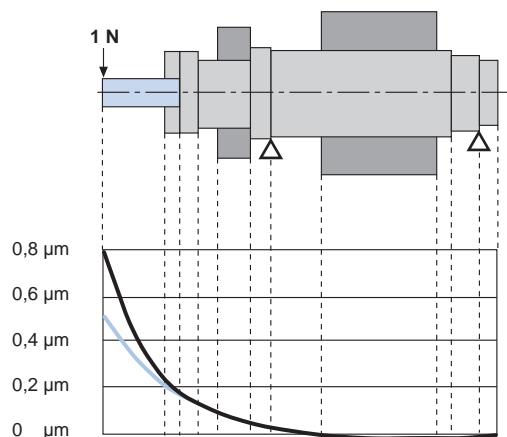

There are several heat shrinking systems available. The most economical for the manual type tool holders is the „HOT AIR“ method.

Tungsten carbide mounted abrasive points
Tungsten carbide milling cutters

The use of tungsten carbide tools is economical due to the cylindrical form and rigid because of the high modulus of elasticity.

The diagram illustrates the calculated stiffness model for a typical spindle shaft with a mounted abrasive point shown in Blue.

Using shrink fit mounted tungsten carbide tool shanks, and applying a radial load of 1 N at the end of the tool, the calculated deflection is 0.5 μm , if the tool were made of standard tool steel and mounted in a collet chuck the deflection would be 0.8 μm . Another advantage of use of carbide significantly lowers the natural frequency of the system.

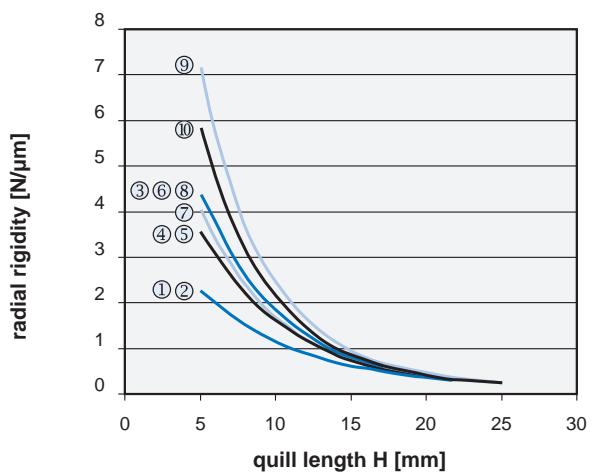

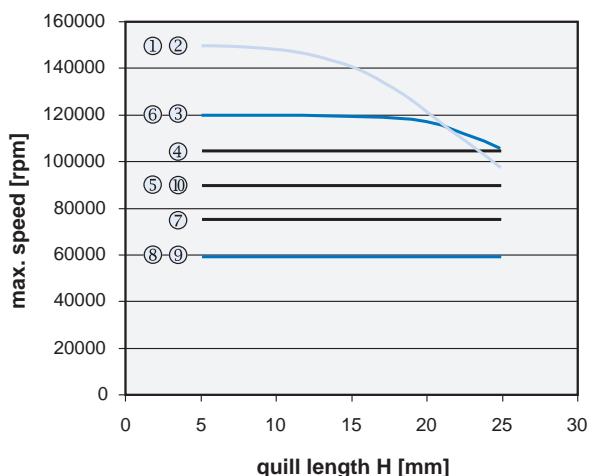

Combining tungsten carbide tools with shrink fit style holders is a technically superior/low cost solution for attaining the critical attributes required in high speed machining.

Shrink Fit Tool Holders

Application restrictions

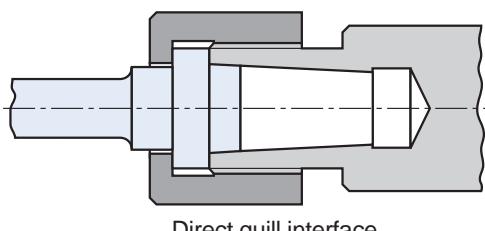

The proper operation of a spindle is determined by effects of tooling lengths, weights, and geometry. The positive qualities of the shrink fit holders and tungsten carbide tooling described in this section are not to be construed as declaration for all applications.

GMN is pleased to offer our analytical services to determine the proper selection for spindles and tooling.

T 12	11.9	5	18.6	4.4	16.85	8

HSK Style Interface

"Hollow tapered shanks with flat contact surfaces" are standard per DIN 69893. The different "FORM'S" of a particular size are based on a similar shank size (d_1) dimension.

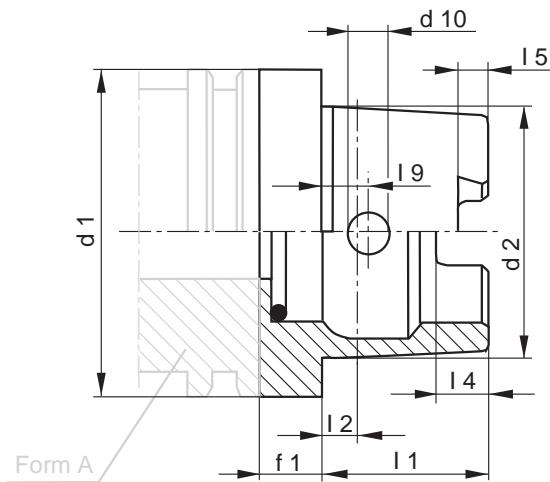

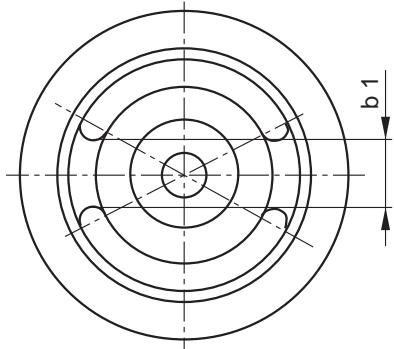

The tool flange is dictated by the mode of tool change.

HSP/HV-P style spindles allow the use of tools with short hollow shanks, type "A" and "C". Form "C" was developed specially for manual tool changing systems. Form "A" is distinguished by the "V" groove provided for automatic tool changing systems.

Form "A" can also be used with the manual tool change system provided in the HSP/HV-P style spindles. This reduces the need for additional tool holders if automatic tool changing systems are already in place.

Tools according to Form B, D, E and F cannot be used in the HSP/HV-P style spindles, they are designed for different applications.

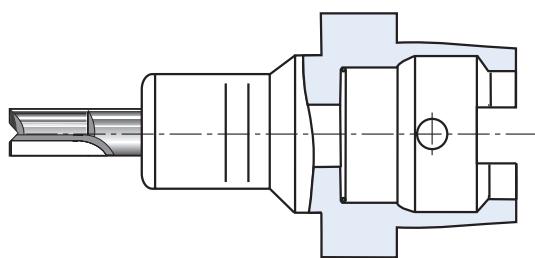

HSK Form C according to DIN 69 893

Nominal size = d1	Taper-Ø d2 [mm]	d10 [mm]	Taper length l1 [mm]	l2 [mm]	l4 [mm]	l5 [mm]	l9 [mm]	b1 [mm]	f1 [mm]

1) During the development of this catalog style HSK 25 was not yet a DIN Standard.

Hollow taper shanks with flat contact surface

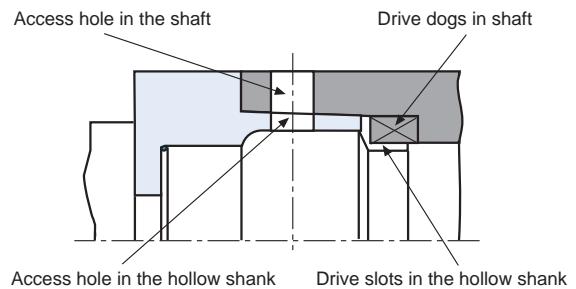

Advantages:

- > High static and dynamic rigidity
- > High tool change accuracy and repeatability
- > Low axial movement during speed variations
- > Increased pull-in force as speed raise
- > High torque transmission
- > Reduced hazard due to internal drive dogs

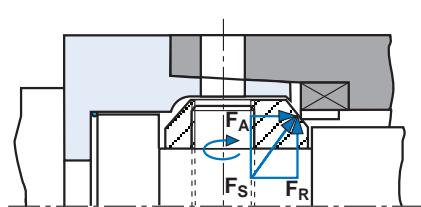

Clamping System

Driving slots

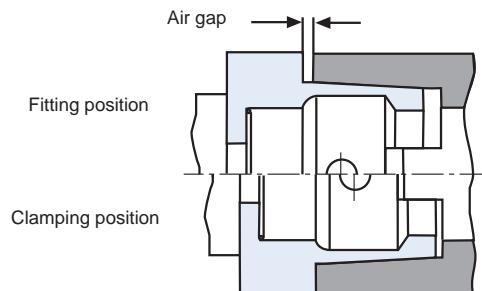

The frictional contact between the tool shank and shaft face provides excellent torque transmission. The internal drive dogs provide additional holding power to keep the access holes aligned in the shaft and tool when overloaded.

Manual actuating

The claws of the gripper assembly are actuated outward, when the radially positioned differential threaded rods are actuated, and force component F_A axially into the tool holder, thus pulling the tool holder shank against the shaft face, and pressing the tapered portion of the shank to its elastic limits against the shaft's internal taper via component F_R .

Hollow shank and axial plane surface

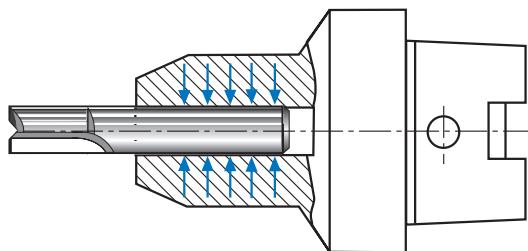

The manual system is designed so that during installation a gap exists between the shank face and the shaft.

The required rigidity is produced through the stress against the taper and axial surfaces generated by the force of the clamping system.

Tools

Shrink fitted tool shank

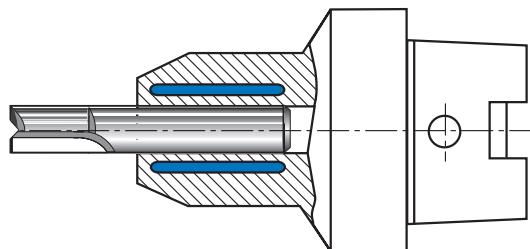

Shrink fitted type holders for cylindrical tool shanks are similar to monolithic holders:

- > high radial rigidity
- > high runout accuracy
- > high transferable torque
- > high repeatability during tool change

A preheater is required.

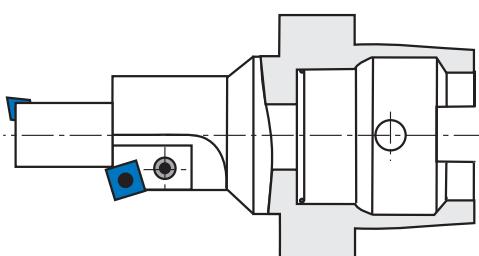

Hydraulic expansion chuck

Hydraulic expansion chucks offer high runout accuracy. Tools can be replaced quickly. A device for exchange is not necessary. Reduction bushings allow smaller shank diameters to be clamped, this can effect the run out.

The oil cell across the tool shank leads to vibration damping and improves the surface quality.

Fine boring tool

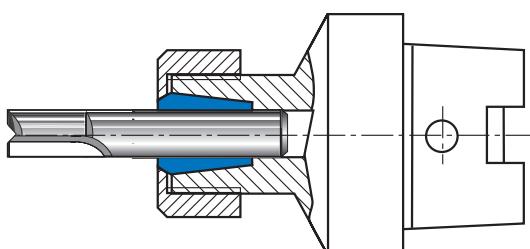

Reversible carbide tipped inserts **must** be positively locked or the strain caused by the centrifugal forces at high speeds, on the screws alone can lead to vibration and shearing.

For safety reasons the permitted peripheral speed must be analyzed and maintained.

Asymmetry causes unbalance. To avoid inadmissible vibrations tools have to be balanced to an acceptable degree.

Collet chuck

Collet chucks are an economical alternative for light duty machining at low speeds, with low accuracy requirements.

Special designs are required for high speed machining.

Collet chucks are readily available and require a minimal effort to change shank sizes.

Safe start due to pre-lubricating

The unit is designed for the optimised supply of lubricant to GMN spindles. The (6) lubricating points allow for the connection of one, two or three spindles. The pre-lubricating cycle guarantees a safe start during machine start-up. The separate monitoring of the oil level assures trouble free completion of the operation.

The supply lines can be laid so that they rise or drop. The line length has to be between 0.5...5 m.

The units

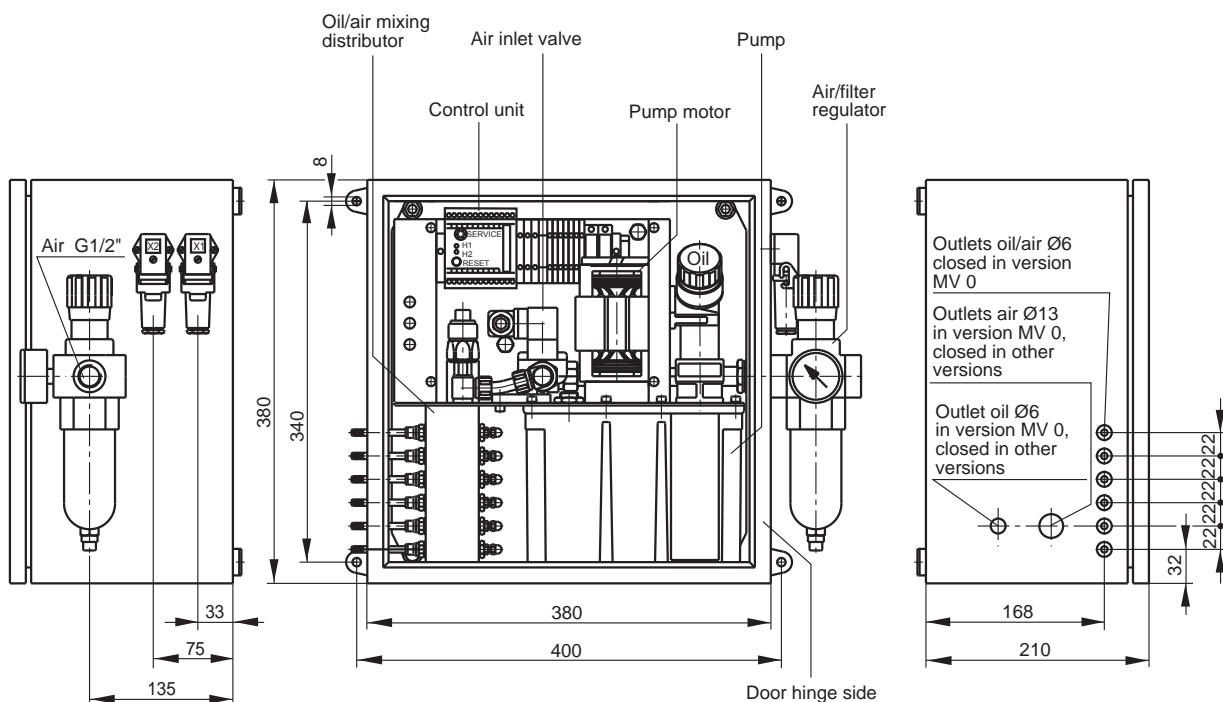

- > PRELUB MV 2 - 2 lubricating point connections
 - > PRELUB MV 4 - 4 lubricating point connections
 - > PRELUB MV 6 - 6 lubricating point connections
- are with integrated oil/air mixing distributor.

The oil/air mixing distributor for PRELUB style MV 0 has to be ordered separately. The mixing distributor can be mounted in up to max. 30 m away the unit.

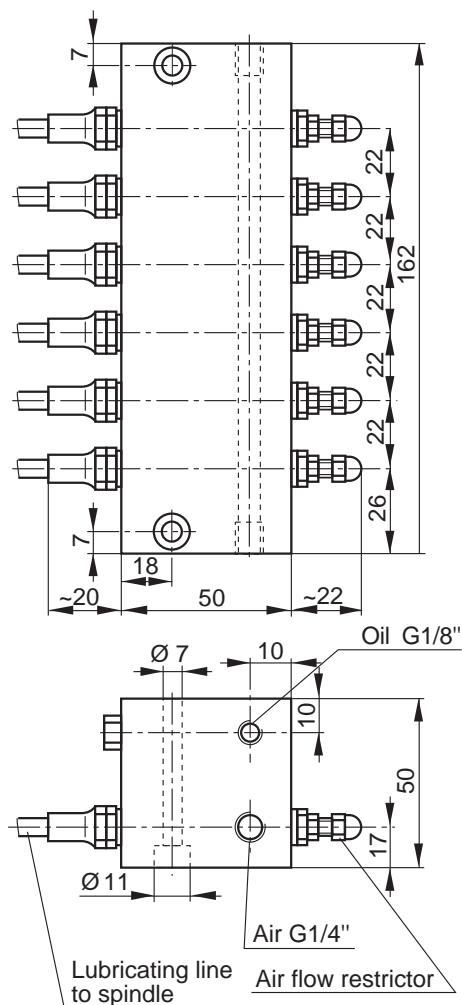

Refer to the spindle operating instruction manual or test certificate for oil quality, cycle times and pressures.

Equipment

- > Air/filter regulator (5 µm) with air gauge
- > Interface with the machine tool control system to signal readiness for operation after checking
 - oil level
 - oil pressure and oil release pressure
 - air pressure
 - pre-lubricating cycle
- > Timer for matching cycle time to oil viscosity and spindle data
- > Lubricating point connections for PVC tubing, O.D 6 mm
- > Operating voltage 230 V, 50/60 Hz
Option 110 V, 50/60 Hz
- > Air supply G 1/2"
 $P_{min} = 6 \text{ bar}$, $P_{max} = 10 \text{ bar}$
- > Power supply and monitoring via connector
- > Installed in control cabinet
380 x 380 x 210 mm (W x H x D)
Enclosure IP 54
- > Colour: RAL 7032 (grey)
- > Fuse protection for 230 V: 1 A; 110 V: 2 A

Oil/air mixing distributor (6 outlets)

Accessories

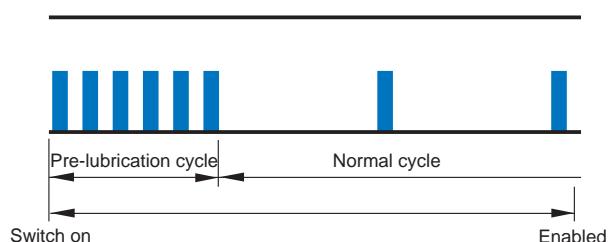

Required accessories for the installation and commissioning such as tubing, pressure gauge and filtered lubricating oil are available.

Maintenance

Compressed air and lubricating oil must be pre-filtered as described in the operating instruction manual.

Replacement filter cartridges are available for both filter elements.

Diagram of pre-lubrication

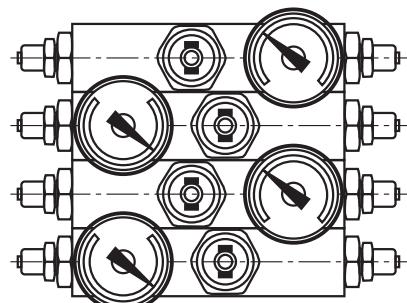

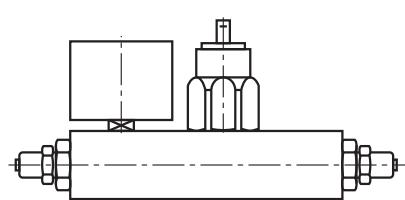

- > Switch on the oil/air lubricator
- > Carrying out the pre-lubrication cycle before the enable signal to the spindle is given for operating:
 - several lubricating pulses within a short time (pre-lubrication cycle)
 - transition to the normal cycle, that means cycle time as during spindle operation
- > The spindle is enabled after the pre-lubrication cycle time is finished (depends on the length of the line)

Control of the air pressure

The reliability and reliability of operation of the oil/air lubricator PRELUB has been confirmed for many years in a lot of applications.

Nevertheless manometric switches can be mounted additional in the lubricating lines on customer's requirements.

The evaluation is made directly by the machine control.

GMN high frequency spindles utilize the most powerful motors available for their size. The current draw through the windings causes extreme temperature rises, which are limited by the insulation.

In order to obtain peak performance the heat must be dissipated.

We can provide the proper size self contained units for removing the motor and bearing heat losses.

- > The units operate with FCKW free refrigerant R407c
- > Coolant temperature 20°C ... 25°C
- > Control hysteresis
Style T: ± 2°K, Style F: ± 1°K
- > Option: for control of axial shaft growth temperature can be controlled to
Style T: ± 1.2°K, Style F: ± 0.5°K
- > Acceptable ambient temperature + 10°C ... + 35°C
- > From 35°C per 1°K will result in a 1% loss in output capacity
- > Option: single supply units for multi spindle applications
- > Fluid level monitoring, flow switch and fault indicator for protecting spindles
- > Colour: grey according to RAL 7032⁵⁾
- > A rust inhibitor must be added to the cooling solution

Style T

Style F

Type	Cooling capacity ³⁾ [kW]	for spindle power [kW] S6-60% S1		Tank capacity [l]	Supply voltage ⁴⁾	Dimensions L x B x H [mm]

1) Permanently adjusted to 23°C.

2) Fault indicator includes additional high and low pressure monitoring.

3) At max. 35°C ambient temperature.

4) Different voltages and frequencies on request.

5) Different RAL colours on request.

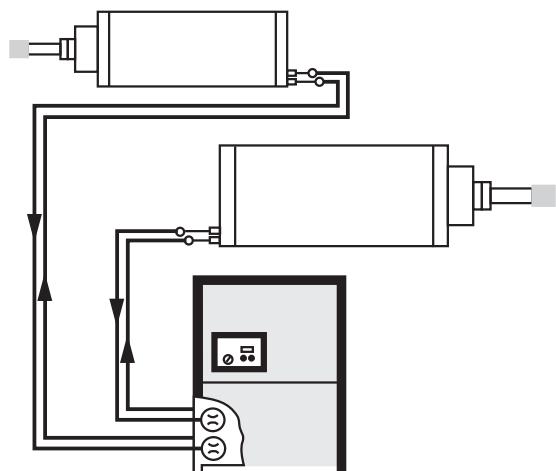

Coolant circulation:

- > The recirculating pump in the chiller moves coolant from the reservoir to the spindle back to the tank.
- > The coolant absorbs heat as it passes through the spindle.
- > The coolant returns to the chiller and passes through the evaporator/heat exchanger where heat is absorbed from the coolant into the refrigerant.
- > The "refrigerated" coolant then returns to the reservoir.

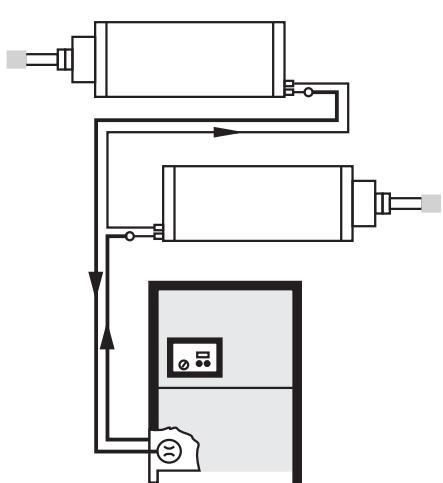

Refrigerant circulation:

- > Cool refrigerant gas is pumped out of the evaporator/heat exchanger by the compressor and compressed into a high temperature, high pressure gas and delivered to the condenser.
- > In the condenser the gas condenses into a liquid as it dissipates heat to the air being blown across the condenser fins.
- > The cooled, high-pressure liquid refrigerant then passes through the expansion valve to the low-pressure side of the evaporator. The refrigerant absorbs heat from the coolant passing through the evaporator as it changes from a liquid to a gas.

Parallel connection:

- > Multiple spindles operating from a single chiller unit.
- > Spindles of different sizes, cooling and flow requirements should be connected in parallel.
- > It is important to select the correct chiller with sufficient cooling and flow capacity for all the spindles being used.
- > Individual flow monitoring units are required for each cooling loop.

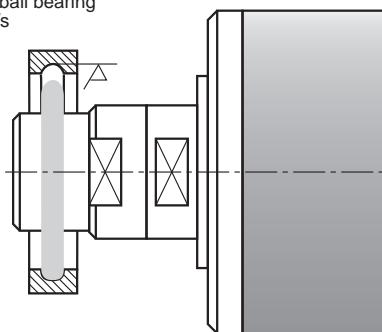

Series connection:

- > Multiple spindles operating from a single chiller unit.
- > Spindles of the same sizes, cooling and flow requirements should be connected in series.
- > Do not plumb more than two (2) spindles in series.
- > A single flow monitoring unit is required for a series setup and mounted at the end of the run.

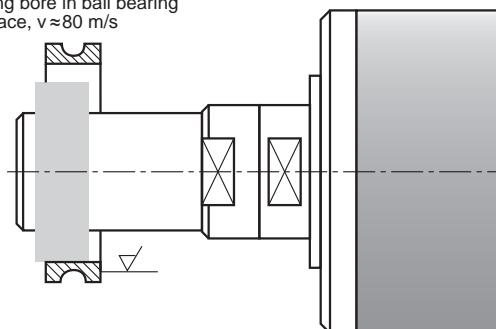

Please contact GMN for assistance in choosing the proper sized chiller unit.

Typical Applications

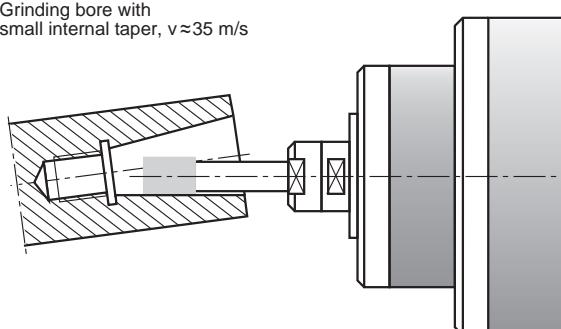

Grinding raceway in ball bearing outer race, $v \approx 80$ m/s

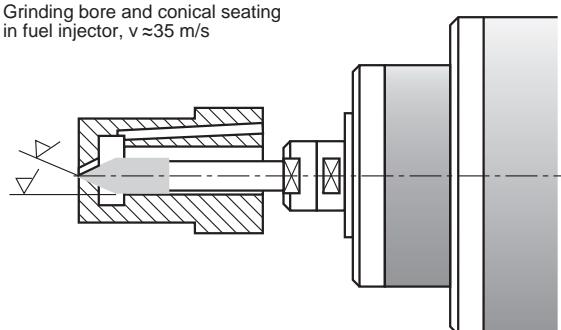

Grinding bore in ball bearing inner race, $v \approx 80$ m/s

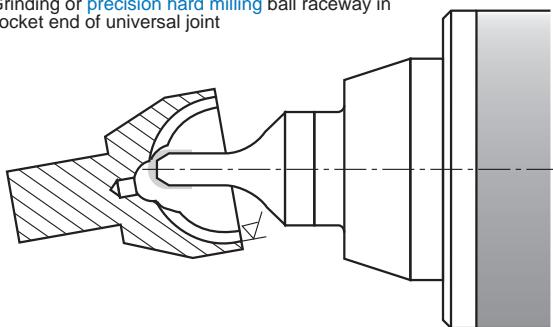

Grinding bore with small internal taper, $v \approx 35$ m/s

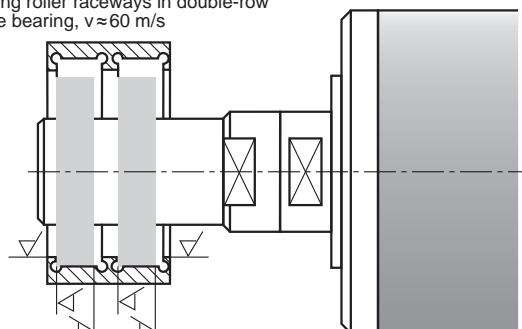

Grinding bore and conical seating in fuel injector, $v \approx 35$ m/s

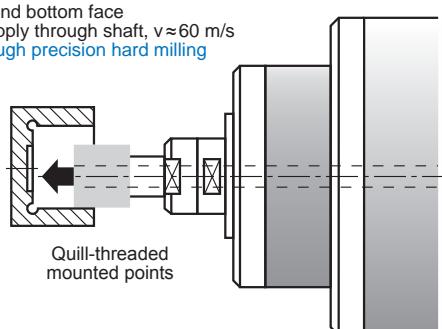

Grinding or [precision hard milling](#) ball raceway in socket end of universal joint

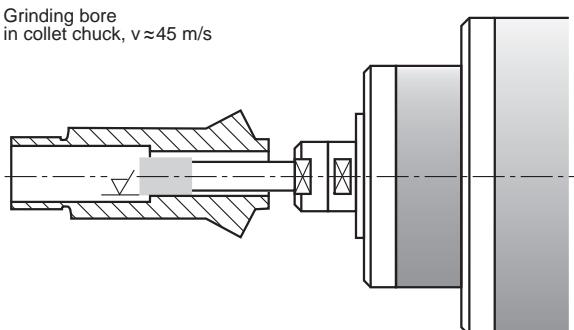

Grinding roller raceways in double-row needle bearing, $v \approx 60$ m/s

Grinding bore and bottom face with coolant supply through shaft, $v \approx 60$ m/s
alternative through [precision hard milling](#)

Grinding bore in collet chuck, $v \approx 45$ m/s

Turn-milling

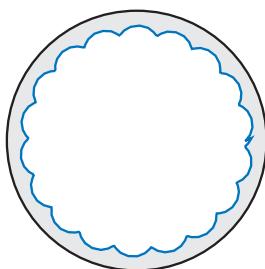

Turn-milling describes a method or processing a rotating workpiece via a rotating tool with geometrical determined cuts, e.g. milling cutter.

Advantages

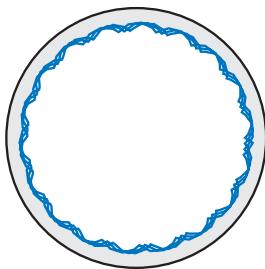

- > high cutting speed when operating next to the rotating axis of the workpieces
- > low forces of gravity while manufacturing unbalanced parts because of low rotational velocity of the workpiece
- > perfect chip breaking due to interrupted cut

Specific attributes for process

- > improved surface quality because of large differential relationship of speed between tool and workpiece
- > improved surface quality because of controlled overlapping of cut traces

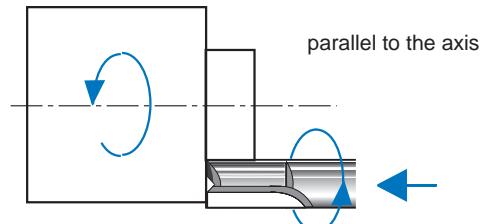

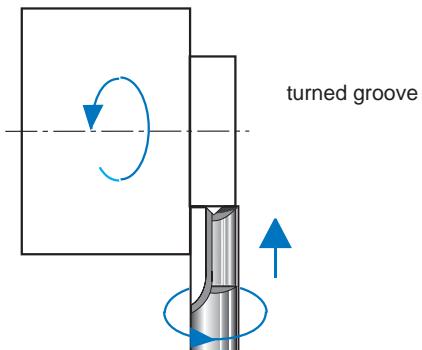

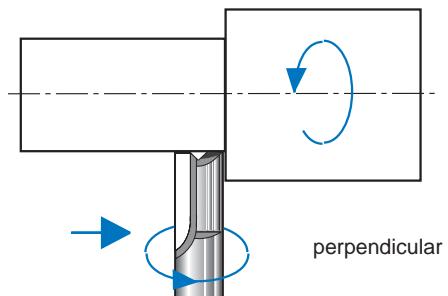

without overlapping
of cut traces

2 times overlapping
of cut traces

Process variations

Workpiece Cooling

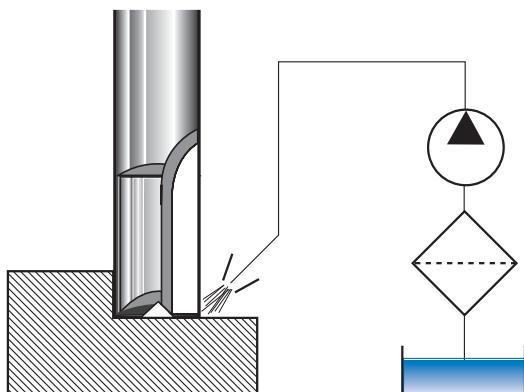

Dry machining

Advantages:

- > no cost for coolant
- > no swarf contamination
⇒ low costs for disposal
- > slight expenditure for sealing machine and spindle
- > environmentally compatible

Disadvantages:

- > lower tool life
- > reduced rate of metal removal
- > surface finish quality

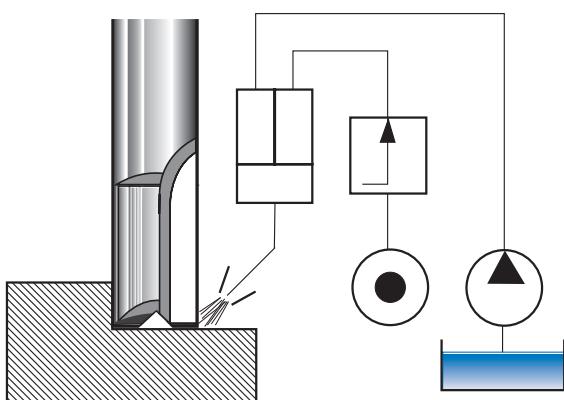

Liquid cooling/lubrication

Advantages:

- > higher surface finish quality
- > size control
- > long tool life
- > large rate of metal removal

Disadvantages:

- > costly machine sealing
- > high costs for chip disposal and used coolant

Spray cooling/lubrication

Advantages versus dry machining:

- > improved tool life and surface finish quality
- > increased rate of metal removal
- > feasible surface protection of workpiece

Disadvantages versus dry machining:

- > costly spindle sealing

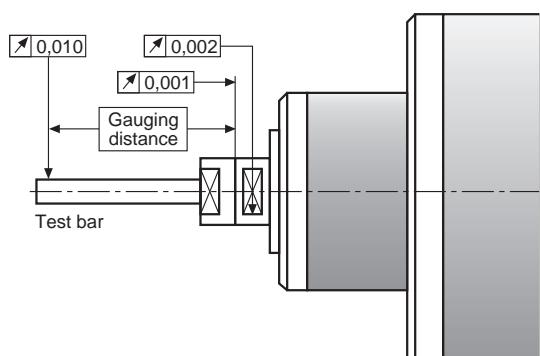

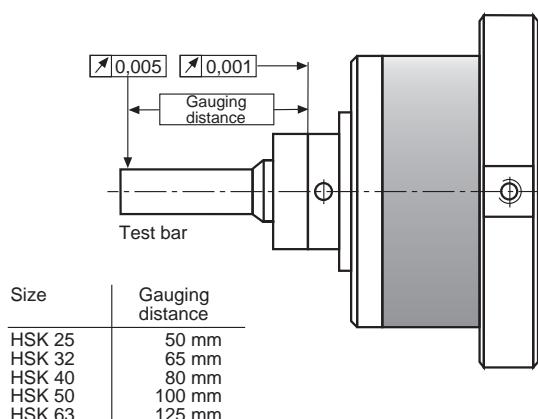

Disadvantages versus liquid cooling/lubrication:

- > more difficult chip removal

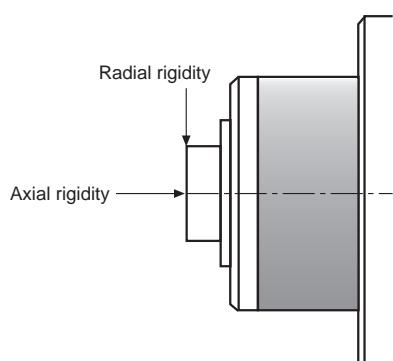

Quality Assurance

Test certificate

The record supplied with every GMN spindle contains actual data about axial and radial rigidity, vibration values, power and temperature. Other measurement conditions and limiting values differing from the GMN test standard can be accommodated.

Gauging distance:
5 x face hole diameter, max. 100 mm

Operating instructions

Operating instructions are available in English and German. They are also obtainable in other languages on request.

Training

Courses with theoretical and practical content for using GMN spindles and fittings and carrying out repair work are offered.

Initial operation

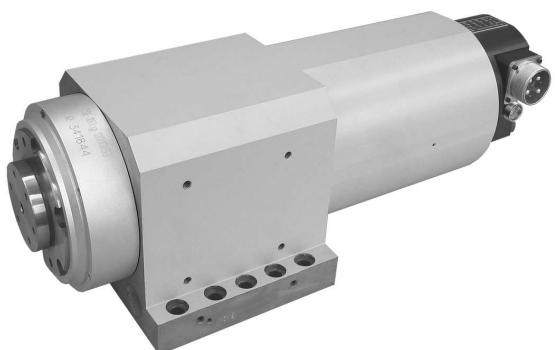

Spindles and spindle systems can be commissioned by GMN technical personnel on request; outside Germany, this may be carried out by our authorised service companies. It is a prerequisite that the spindle is correctly installed using correct materials, fluids and initial start-up preparation.

Repair service

We recommend that the spindles are repaired by us or our authorized repair shops.

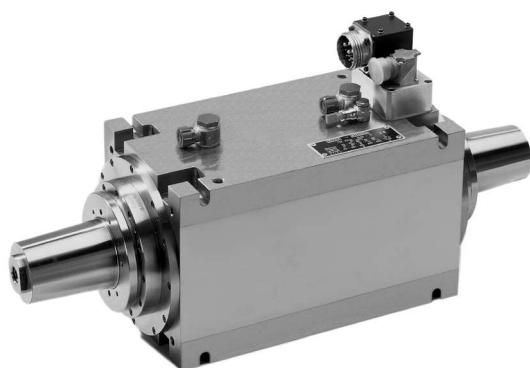

The GMN spindle repair service offers cost-effective, rapid and professional work. We also have the necessary special equipment, such as balancing instruments, vibration and rigidity measuring instruments and devices for assembly and dismantling.

Successful Specific Spindles

TSE 180cg - 12000/30

- n_{max} 12000 rpm
- P (S1) 30 kW at 12000 rpm
- M (S1) 23,9 Nm
- Tool interface: face clamping and draw thread
- Speed sensor
- Permanently grease lubricated
