# Keep your equipment – and your business – moving forward

The whole world is on the move today. Everything from people and products to ideas and information That means business has to be on the move, as well. Regal Power Transmission Solutions can help. We keep products – and businesses – moving forward. Whether it's helping to make sure that packages arrive on time, roads are built, energy is produced, food and beverages are processed, or luggage arrives at airport baggage areas, our products and solutions help make the world go.

# The Regal Power Transmission Solutions Advantage

Regal Power Transmission Solutions brings you more than a century of technology and engineering experience. As a Regal Power Transmission Solutions business, we are part of one of the world's leading suppliers of innovation and insight, providing solutions to customers around the world. Backed by extraordinary technological capabilities and resources, we can deliver customized, competitively valuable solutions that meet the unique needs of each of our customers.

# Time-tested Brand Performance

Regal Power Transmission Solutions is a family of respected product brands that supply a variety of power transmission components designed to increase both uptime and productivity. Each of our brands brings years of time-tested reliability and proven performance results. Together they deliver a product line unparalleled in its breadth.

**Browning**

Founded in 1886, Browning is the world leader in V-belt drives and helical shaft-mounted speed reducers. Browning also offers a broad range of other products, including gearing, mounted ball bearings, mounted roller bearings and sprockets.

**JAURE**

Founded in 1958 in Spain, Jaure is a leader in the European marketplace. Jaure provides highly engineered couplings for industries ranging from steel and paper, hoisting to windmills and marine applications.

**KOP-FLEX**

Founded in 1920, Kop-Flex brings over 80 years of design and application experience to a wide range of industries. Kop-Flex products include gear, disc and resilient shaft couplings.

**McGILL**

Founded in 1905, McGill patented the CAMROL® cam-follower bearing, which today is offered in more than 1,400 different combinations and configurations. McGill products also include aerospace bearings, needle and spherical bearings.

**Morse**

Founded in 1880, Morse is well known for its performance-proven roller-chain drives, clutches, worm-gear speed reducers and couplings.

**ROLLWAY**

Founded in 1908, Rollway provides over 2,000 different types of cylindrical roller bearings, cylindrical and tapered thrust bearings and extra-large roller bearings.

**SEALMASTER**

Founded in 1935, Sealmaster is the industry's preferred bearing product, known for its premium-quality mounted ball-bearing line, as well as its mounted roller bearings.

**SYSTEM  
PLAST**

Founded in 1985, System Plast S.p.A. is a global supplier of steel and engineered plastic conveying chains and chain tracks, modular plastic belts, composite housed bearings and Valu Guide® conveyor components and guide rails.

## A History of Innovation

Our tradition of innovation goes far beyond our product enhancements. We've been at the forefront in offering across-the-board improvements in everything from manufacturing techniques to online tools as well as our Customer Solution and Innovation Centers.

## Manufacturing

Our lean-manufacturing capabilities, coupled with our combined engineering expertise and our global facilities, lets us deliver the solutions you need – when and where you need them. In addition, our bearings group continues to advance its assemble-to-order (ATO) capabilities. The result? Fast, accurate production that outpaces industry standards. Meanwhile, our coupling operation's engineered to order (ETO) process offers specific customer application solutions.

## Online Tools

Our EDGE® Online industry-leading consultative website ([www.RegalPTS.com](http://www.RegalPTS.com)) offers quick, concise and complete access to a wide range of support services, including:

- eCatalog
- Product selection
- Engineered solutions
- EDGE JIT – a seamless, web-based program that selects drives at the lowest transactional costs
- eLINK – a transaction tool that lets you instantly contact us for messages and updates on:
  - Stock/price checks
  - Order status
  - Shipment tracking
  - Smart interchange
  - Product literature
  - CAD templates
  - Order entry
  - Quote center
  - Shopping list (favorites)

## Training

PT University® online training program helps make sure that your personnel receive the training they require. Regal Power Transmission Solutions provides comprehensive, high-quality product training for our customers. Our cutting edge training tools, coupled with our experienced training personnel, deliver unsurpassed product knowledge to customers everywhere. We can tailor training to programs that best fit your needs, including online and instructor-led courses.

## Technical Support

For added technical support, we provide:

- Research & design – Regal Power Transmission Solutions spends 3.5% of its total revenue on R&D
- Six global technical support centers
- International technical support
- Around-the-clock service availability, via our Application Engineering Department (800-626-2093), e-mail or online chat

## Channel Partners

Regal Power Transmission Solutions has distribution channel partners throughout the world offering a wide variety of value-added services. For a full listing of our authorized distributors, technical support centers and online tools, visit [www.RegalPTS.com](http://www.RegalPTS.com)

## The Power of People

The real innovation behind our products comes from our people. Our engineers study your unique industry challenges as thoroughly as their own areas of expertise. Meanwhile, our sales force and field-service personnel also work hard to understand the challenges of every customer, in every marketplace and industry. Finally, our customer service representatives are always ready and available to answer any questions, solve problems or deal with any issues.

# About This Catalog

Inside this catalog, you will find the common range of unmounted and mounted bearing products offered by Regal Power Transmission Solutions, carrying the globally recognized brands: Browning, McGill, Rollway and Sealmaster.

To help you easily locate the information you are looking for this catalog has been laid out in a consistent format between the various brands and bearing types. The structure of the catalog is as follows:

## Bearing Basics

This section includes general engineering information pertaining to bearing types, selection criteria, standard formulas used across the various bearing types such as L10, lubrication methods and types.

## Product Sections

The following information typically appears in each product section.

## Product Type Overview

A short descriptive narrative of the bearing types found in this section.

## Section Table of Contents

A pictorial and descriptive table allowing you to narrow down the bearing type required for specific application or design need.

## Exploded Product View

An exploded product view highlighting various critical components of the bearing.

## Product Nomenclature

A breakdown of the part nomenclature (description) as a guide to easily understand the part numbers, and shows the standard and common optional features.

## Standard Product Features & Benefits

Additional details of the key components highlighted in the exploded view detailing the specific feature and reviewing why it is a benefit to you the user.

## Optional Product Features & Benefits

A listing of the common options available to further enhance bearing performance in your application or features tailored to specific applications such as high speed, high temperature, low temperature, etc.

## Product Tables

- A 3D Model of the bearing product at the top of the page to clearly identify what the product looks like.
- Basic Product Information to help guide the user in understanding the key product attributes.
- A 2D Line Drawing with dimensional call outs that have been standardized across product types for easy comparisons.
- Table with inch and metric dimensions listing the critical dimensions for design and selection as shown in the 2D line drawing, including the bearing dynamic capacity, and mass in lbs. and kgs.
- Special notes or instructions pertaining to the specific product shown.

## Engineering Section

Technical information pertaining to the information found in the section. The technical information will vary slightly by product type such as speed limits, lubrication recommendations, series codes, internal and mounting clearances, and mounting instructions.

# Bearing Selection

## Introduction

The following general information will serve the purpose of aiding the machine designer or bearing user when applying the bearings covered in this catalog. Additional data dealing solely with each type of bearing is found in each respective section. Cross references are made whenever necessary. Engineering data should be carefully considered in selecting the proper design and size bearing.

For those applications where unusual or abnormal operating conditions exist, it is advisable to consult Application Engineering for recommendations. Examples of such conditions requiring special consideration are those involving high or low temperatures, misalignment, shaft and housing fits that might cause the bearing to be too tightly fitted internally after mounting, vibration, moisture, contamination, etc.

## Application Considerations

The proper selection and application of power transmission products and components, including the related area of product safety, is the responsibility of the customer. Operating and performance requirements and potential associated issues will vary appreciably depending upon the use and application of such products and components. The scope of the technical and application information included in this publication is necessarily limited. Unusual operating environments and conditions, lubrication requirements, loading supports, and other factors can materially affect the application and operating results of the products and components and the customer should carefully review its requirements. Any technical advice or review furnished by Regal Power Transmission Solutions and its divisions with respect to the use of products and components is given in good faith and without charge, and Regal assumes no obligation or liability for the advice given, or results obtained, all such advice and review being given and accepted at customer's risk.

For a copy of our **Standard Terms and Conditions of Sale, Warranty, Limitation of Liability and Remedy**, please contact Regal Power Transmission Solutions customer service, 1-800-626-2120. These terms and conditions of sale, disclaimers and limitations of liability apply to any person who may buy, acquire or use an Regal Power Transmission Corporation product referred to herein, including any person who buys from a licensed distributor of these branded products.

## Nuclear Applications

### **Goods and/or Services Sold Hereunder are not for use in any Nuclear and Related Applications**

Buyer accepts goods and/or services with the foregoing understanding, agrees to communicate the same in writing to any subsequent purchaser or users and to defend, indemnify and hold harmless Seller from any claims, losses, suits, judgments and damages, including incidental and consequential damages, arising from such use, whether the cause of action be based in tort, contract or otherwise, including allegations that the Seller's liability is based on negligence or strict liability.

# Bearing Selection Continued

## Bearing Selection

Before beginning the bearing selection process for a particular application it is important to have a good idea of where the bearing will be installed, what its purpose will be, what operating conditions will the bearing be expected to function in, and a desired bearing life. Each bearing type has certain characteristics which make it suitable for a certain application(s). Having comprehensive knowledge of these requirements will aid in bearing selection. In most cases there are several factors to consider when choosing a bearing type. Therefore the following information is to be used only as a guide. In the selection process the following factors must be considered:

1. **Equipment constraints**
2. **Load – Magnitude and Direction**
  - Magnitude
  - Direction
    - ◇ Radial
    - ◇ Thrust
    - ◇ Combined
3. **Misalignment**
  - Static
  - Dynamic
4. **Expansion**
5. **Noise**
6. **Vibration and shock loading**
7. **Environment**
8. **Bearing Type**

## Equipment Constraints

Sometimes, bearing bore diameter and housing type are predetermined by the equipment and shaft diameter with which the bearing will be used. Small diameter shafts typically are used when light loads are transferred and may lead to the choice of a ball bearing. Higher loads typically dictate larger shaft diameters and then taper or spherical roller bearings may be needed. For mounted bearings, equipment constraints can also dictate what type of housing style can be used (i.e. pillow block, 2-bolt flange, 4-bolt flange, etc.).

## Load – Magnitude and Direction

Load magnitude typically dictates size of bearing required but it can also affect the type of bearing. Ball bearings work well in light to moderate loads, roller bearings work well for moderate to heavy loads. Bearings with a full complement of rollers are generally better for higher loads than a caged bearing of the same size and full complement bearings are also recommended for applications with oscillatory rotation.

Load direction can be radial, axial, or a combination of these two directions. These directions along with load magnitude are deciding factors in selection of bearing type.

## Bearing Selection Continued

Radial loading is the most common type of bearing load and is defined as a load perpendicular, or 90 degrees to the shaft centerline. Most ball and roller bearings are designed to accept primarily radial loads.

Thrust, or axial, loading is defined as loading in the direction through the shaft centerline. The ability of the bearing to carry a thrust load is dependent on the bearing contact angle geometry. The larger the contact angle the more thrust load that can be carried. Typically, tapered roller and double row spherical roller bearings are better suited for applications with a higher degree of thrust load.

Combination loading consists of both a radial and a thrust load acting simultaneously on the bearing. When combination loads are acting on a bearing it is necessary to determine an equivalent radial load when calculating bearing life.

### Misalignment

Bearing misalignment is a result of angular misalignment between the shaft and housing. This misalignment comes in two different forms, static and dynamic. Static misalignment is the outcome of bearings that are mounted on different planes causing an angular shaft displacement and resulting in the bearing operating under a fixed misalignment angle. Mounted ball bearings, certain series mounted roller bearings, and spherical roller bearings have a design feature that allows them to accommodate a limited degree of fixed misalignment. Dynamic misalignment is an eccentric shaft rotation caused by shafting imperfections and resulting in the bearing operating under a varying misalignment angle. Spherical roller bearings are typically best suited for applications involving dynamic misalignment.

**Static System Misalignment**

**Dynamic System Misalignment**

## Bearing Selection Continued

Each bearing type is capable of accommodating a certain amount of either static, dynamic, or combination misalignment. When application misalignment exceeds the allowable limit for the particular bearing, increased contact stresses between bearing rolling elements and raceways occurs and bearing life is reduced. Individual product sections contain additional information regarding what types and degrees of misalignment each bearing type is capable of handling.

**Example of Sealmaster Mounted Spherical Roller Bearing Misalignment**

### Expansion

For applications in which shaft linear growth must be accommodated, this expansion must be taken into account with either the bearing mounting method or bearing type selection. Typically this expansion is due to the difference in thermal changes in the shaft versus that in the support structure. Therefore change in length can be determined using standard thermal expansion equations. The maximum temperature difference between the shaft and the support structure should be used in the calculation of the shaft growth. Likewise, consideration must be given to the shaft and structure materials, as different materials can have different rates of expansion or contraction.

To allow for shaft expansion, some applications will require the bearing to be of an expansion type. An expansion type bearing is one that has an internal design feature which allows it to accommodate axial expansion. Before installation, make sure proper linear shaft expansion is accounted for. Expansion units should be placed in a location where relative movement between the bearing insert and the housing can be tolerated. For most applications using expansion type units, the fixed unit (non-expansion unit) is placed at the drive end of the shaft. Not providing expansion where necessary may result in undesirable thrust loads, thus reducing bearing operating life.

**Example of Sealmaster Mounted Spherical Roller Bearing Expansion and Non-Expansion**

## Bearing Selection Continued

### Noise

Noise sensitive applications such as fans require smooth running bearings. These are typically low duty environments which makes ball bearings a good choice. Concentric locking mechanisms are preferred to keep vibration at a minimum, but not required. Regal Power Transmission Solutions offers a special suffix that can be applied to many mounted ball bearing products for air handling applications. This option offers a loose fit between the bearing insert and housing for easy self-aligning, as well as noise testing of all units.

### Vibration and Shock Loading

Vibration and shock loading present in vibratory conveyors, shakers, and other heavy industrial applications transfer large forces to bearings and accompanying raceways. These loads create large stresses at the interface between the rolling elements and raceways and can cause considerable damage and a reduction of bearing life. Roller bearings may be a good selection because of their larger supporting contact area with the bearing races. This allows loads to be carried over a larger area thus reducing stress. Special housing fits for mounted bearings can be added from the factory to aid in longer bearing life.

### Environment

Environmental factors such as solids contamination (particle type, size, quantity), exposure to moisture (water, acid caustic), and thermal conditions are important variables in bearing selection. Bearing components (seals, grease, bearing material, etc.) can be modified in order to better suit a specialized application. Availability of special features may be affected by shaft size, bearing type, and housing type therefore this must be considered in the bearing selection process. Individual product sections contain additional information regarding these specialized features and availability.

### Bearing Type

#### Radial Ball Bearings

Radial ball bearings create a fairly small elliptical contact between the ball-path and rolling element thus distributing loads across a small area. Surface contact is minimized and less friction and heat is generated which allows ball bearings a higher speed range. This small contact area also limits ball bearings to accepting only light to moderate loads. Radial ball bearings have a zero degree free contact angle but can accept light thrust loads (in combination with a radial load) due to the shape geometry of their raceways. Mounted ball bearing units have some degree of external static self-aligning capability (the bearing insert can misalign with respect to the housing). Mounted ball bearings come in a variety of housing styles and features to suit a wide variety of applications.

## Bearing Selection Continued

### Tapered Radial Roller Bearings

Tapered radial roller bearings create a line contact between the raceway and rolling element distributing loads across a larger area. Also, a double row provides twice as many rolling elements available to carry bearing load which increases bearing load capacity. Because tapered roller bearings are set at an angle, they can accept heavy loads from both the radial (Y) and thrust (X) directions. This makes them ideal for tough applications such as mining, bulk material handling, and off-highway applications. Many mounted tapered roller bearing units are similar to mounted ball units in that they are externally self aligning to accommodate some static misalignment. There are a variety of housing styles and features available.

### Spherical radial roller bearings

Spherical radial roller bearings have a barrel shaped profile. This combined with a curved raceway allows relative motion between the rolling elements and raceways (internally self-aligning). This attribute makes them ideal for application where both static and dynamic misalignment is present. Spherical roller bearings create an elliptical shaped contact area that is larger than a ball bearing. Single row design spherical roller bearings should not be used in combined loading applications when the thrust load exceeds 20% of the applied radial load. Mounted spherical roller bearings employ a double row design, which are set at an angle and can accept a limited degree of thrust load in combination with radial load. Due to some sliding that occurs at the bearing and raceway interface, spherical roller bearings are generally not suitable for higher speed applications.

### Needle Radial Roller Bearing

A needle radial roller bearing is a cylindrical roller where the length of the roller is significantly larger than the diameter. The rollers make a large line contact with the raceways, allowing them to accept fairly high radial load. Needle roller bearings also do not have a contact angle and are not recommended in applications where thrust loading is present. If high thrust loads are present, provisions should be put in place to allow bearings better suited to handle the thrust loads. Needle bearing assemblies typically consist of an inner race (or sometimes a precision shaft), a needle cage which orients and contains the needle rollers, the needle rollers themselves, and an outer race. The needle cage is sometimes omitted and a full complement of rollers is used instead for oscillatory and high load applications.

## Bearing Selection Continued

### Cylindrical Radial Roller Bearings

Cylindrical radial roller bearings are similar in design to needle roller bearing but the dimensions of diameter and roller length are closer in magnitude. The rolling elements create a line contact with the raceways and can handle relatively high radial loads. These bearings typically use cage separated rollers which allows for higher operating speeds. Cylindrical roller bearings can also accept incidental to light thrust loads. Rollway Cylindrical roller bearings are crowned to maximize load carrying potential, reduce edge loading, and tolerate some minor misalignment.

### Thrust Cylindrical Roller

Thrust cylindrical roller and thrust spherical roller bearings use rolling elements as described above. However, instead of radial rings for raceways, thrust bearings use plate rings so that these designs can be applied to support pure thrust loads. These designs do not support radial loads. The cylindrical roller type provides a fairly rigid construction capable of supporting fairly heavy thrust loads. The spherical roller type can also support heavy thrust loads, and can also accommodate some misalignment.

### Rod ends

Rod ends are designed to provide an efficient smooth transfer of motion in a wide variety of applications and equipment. This motion is usually associated with various types of linkage controls. Commonly referred to as plain or sliding bearings, they are designed primarily to assist and provide motion transfer, support a load, allow for angular motion and angular misalignment.

Rod ends can be joined together or connected with a threaded rod or tube to form linkage assemblies allowing design engineers flexibility in transferring motion between points with long center distances. There are two surface areas in contact rubbing against each other, therefore normal operation of rod ends results in wear of the raceways leading to fatigue or fracture of the outer member. Give consideration to this in the design of the equipment. In general, rod ends are designed to accept radial loads and not intended to carry thrust loads. Applications of rod ends with thrust loading should be reviewed with Application Engineering.

### Spherical Plain Bearings

Spherical plain bearings provide a similar function as rod ends and must be supported in a housing. Spherical bearings are typically more capable of supporting higher loads versus an equivalent rod end bore size. This occurs because rod end load capacity is controlled by the head and shank geometry. Spherical bearings have a larger bearing area and generally are less restricted by the housing material or dimensions in which they are mounted. Static thrust rating of plain spherical bearings is 20% of the static radial rating of each unit but proper housing design is needed to support the bearing.

# Bearing Selection Guide

The following chart can be used as a reference guide when working through the selection process. More detailed information on each bearing type as well as the available housing and seal options can be found in sections dealing with the individual bearing types.

	Bearing Type	Pure Radial Loading	Pure Axial Loading	Combination Loading	High Speeds	Static Self-Aligning Capability	Dynamic Self-Aligning Capability

# Load Ratings and Life

## Introduction

The following general information will serve the purpose of aiding the machine designer or bearing user when applying bearings covered by this catalog. Additional data dealing solely with each type of bearing is found in each respective section. Cross references are made whenever necessary. Engineering data should be carefully considered in selecting the proper design and size bearing.

For those applications where unusual or abnormal operating conditions exist, it is advisable to consult Application Engineering for recommendations. Examples of such conditions requiring special consideration are those involving high or low temperatures, misalignment, shaft and housing fits that might cause the bearing to be too tightly fitted internally after mounting, vibration, moisture, contamination, etc.

## Load Ratings

The basic load rating or Basic Dynamic Rating as defined by the American Bearing Manufacturers Association (ABMA) is that calculated, constant radial load which 90% of a group of apparently identical bearings with stationary outer ring can theoretically endure for a Rating Life. For bearing types other than tapered roller, the basic rating life is one million revolutions (33 1/3 RPM for 500 hours). For tapered roller bearings, the basic rating life is ninety million revolutions. The basic load rating is a reference value only, the basic rating life value having been chosen for a means of life calculation.

It is not anticipated that bearing loading equal to the Basic Dynamic Rating would normally be applied while the bearing is rotating. Bearings in this catalog should not normally be subjected to dynamic loads greater than 50 percent of the Basic Dynamic Rating. Consult Application Engineering if such conditions exist.

## Bearing Life – L10

Bearings which have been properly sized for the application, solidly mounted, lubricated, and protected will operate with minimal, if any, internal wear until fatigue of the rings or rolling elements takes place. Fatigue is the first evidence of spalling of the rolling contact surfaces of these parts, and occurs because of the repeated stressing of the contacts.

The “life” of an individual bearing is defined as the number of revolutions (or hours at a given constant speed) which the bearing runs before the first evidence of fatigue develops in the material of either ring or of any of the rolling elements. The L10 or “rating life” of a group of apparently identical roller bearings is defined as the number of revolutions (or hours at some given constant speed) that 90% of the group of bearings will complete or exceed before the first evidence of fatigue develops.

# Load Ratings and Life

## Life Calculations

The L10 (rating) life for any given application and bearing selection can be calculated in terms of millions of revolutions by using the bearing Basic Dynamic Rating (BDR) and applied radial load (or, equivalent radial load in the case of radial bearing applications having combined radial and thrust loads). The L10 life for any given application can be calculated in terms of hours, using the bearing Basic Dynamic Rating, applied load (or equivalent radial load) and suitable speed factors, by the following equation:

$$L_{10} = \left(\frac{C}{P}\right)^p \times \frac{1,000,000}{60 \times n} = \left(\frac{C}{P}\right)^p \times \frac{16667}{n}$$

Where:  $L_{10}$  = The # of hours that 90% of identical bearings under ideal conditions will operate at a specific speed and condition before fatigue is expected to occur.

C = Basic Dynamic Rating (lbs)  
1,000,000 Revolutions

P = Constant Equivalent Radial Load (lbs)

p = Exponent for life  
3 for ball bearings  
10/3 for roller bearings

n = Speed (RPM)

For thrust cylindrical roller and thrust tapered roller bearings the above equations change to:

$$L_{10} = \left(\frac{C}{P}\right)^{10/3} \times \frac{1,000,000}{60 \times n} = \left(\frac{C}{P}\right)^{10/3} \times \frac{16667}{n}$$

Where:  $L_{10}$  = The # of hours that 90% of identical bearings under ideal conditions will operate at a specific speed and condition before fatigue is expected to occur.

C = Basic Dynamic Thrust Rating (lbs)  
1,000,000 Revolutions

P = Constant Equivalent Thrust Load (lbs)

p = 10/3

n = Speed (RPM)

The BDR for tapered roller bearings is based on 90 million revolutions instead of one million for other types of bearings. Therefore there is a specific equation used to calculate their L10 life.

$$L_{10} = \left(\frac{C90}{P}\right)^{10/3} \times \frac{90,000,000}{60 \times n} = \left(\frac{C90}{P}\right)^{10/3} \times \frac{1,500,000}{n}$$

Where:

Where:  $L_{10}$  = The # of hours that 90% of identical bearings under ideal conditions will operate at a specific speed and condition before fatigue is expected to occur.

C90 = 2-Row Basic Dynamic Rating (lbs)  
90,000,000 Revolutions

P = Constant Equivalent Radial Load (lbs)

n = Speed (RPM)

\* For speeds less than 50 RPM, use 50 RPM when doing L10 calculations.

Note: L10 life does not apply to rod ends and plain spherical bearings due to the sliding motion between components versus a rolling motion. Normal operation of these types of bearings results in wear of the raceways or fatigue or fracture of the outer member. Give consideration to this in the design of the equipment.

## Load Ratings and Life Continued

Additionally, the ABMA provides application factors for all types of bearings which need to be considered to determine an adjusted Rated Life ( $L_{na}$ ). L10 life rating is based on laboratory conditions yet other factors are encountered in actual bearing application that will reduce bearing life.  $L_{na}$  life rating takes into account reliability factors, material type, and operating conditions.

$$L_{na} = a_1 \times a_2 \times a_3 \times L_{10}$$

Where:

$L_{na}$  = Adjusted Rated Life.

$a_1$  = Reliability Factor. Adjustment factor applied where estimated fatigue life is based on reliability other than 90% (See Table No 1).

Table No. 1 Life Adjustment Factor for Reliability

Reliability %	$L_{na}$	$a_1$
90	L10	1
95	L5	0.62
96	L4	0.53
97	L3	0.44
98	L2	0.33
99	L1	0.21
50	L50	5

$a_2$  = Material Factor. Life adjustment for bearing race material. Regal Power Transmission Solutions bearing races are manufactured from bearing quality steel. Therefore the  $a_2$  factor is 1.0.

$a_3$  = Life Adjustment Factor for Operating Conditions. This factor should take into account the adequacy of lubricant, presence of foreign matter, conditions causing changes in material properties, and unusual loading or mounting conditions. Assuming a properly selected and mounted bearing having adequate seals and lubricant operating below 250°F and tight fitted to the shaft, the  $a_3$  factor should be 1.0.

Mounted bearings are typically “slip fitted” to the shaft and rely on design features such as the inner race length and locking device for support. ABMA recommends an  $a_3$  factor of .456 for “slip fit” ball bearings.

Vibration and shock loading can act as an additional loading to the steady expected applied load. When shock or vibration is present, an  $a_3$  Life Adjustment Factor can be applied. Shock loading has many variables which often are not easily determined. Typically, it is best to rely on one’s experience with the particular application. Consult Application Engineering for assistance with applications involving shock or vibration loading.

The  $a_3$  factor takes into account a wide range of application and mounting conditions as well as bearing features and design. Accurate determination of this factor is normally achieved through testing and in-field experience. Regal Power Transmission Solutions offers a wide range of options which can maximize bearing performance. Consult Application Engineering for more information. Example calculations can be found in the individual engineering sections at the end of the various product sections.

## Load Ratings and Life Continued

### Variable Load Formula

Root mean load (RML) is to be used when a number of varying loads are applied to a bearing for varying time limits. Maximum loading still must be considered for bearing size selection.

$$RML^* = \sqrt[p]{\frac{(L_1^p N_1) + (L_2^p N_2) + (L_3^p N_3)}{100}}$$

Where:

p = Exponent for life  
3 for ball bearings

10/3 for roller bearings

L<sub>1</sub>, L<sub>2</sub>, etc. = Load in pounds

N<sub>1</sub>, N<sub>2</sub>, etc. = Percent of total time operated at loads L<sub>1</sub>, L<sub>2</sub>, etc.

\* Apply RML to rating at mean speed to determine resultant life.

### Mean Speed Formula

The following formula is to be used when operating speed varies over time.

$$\text{Mean Speed} = \frac{S_1 N_1 + S_2 N_2 + S_3 N_3}{100}$$

S<sub>1</sub>, S<sub>2</sub>, etc = Speeds in RPM

N<sub>1</sub>, N<sub>2</sub>, etc = Percentage of total time operated  
at speeds S<sub>1</sub>, S<sub>2</sub>, etc

### Bearing Life In Oscillating Applications

The equivalent rotative speed (ERS) is used in life calculations when the bearing does not make complete revolutions during operation. The ERS is then used as the bearing operating speed in the calculation of the L10 (Rating) Life. The formula is based on sufficient angular rotation to have roller paths overlap.

**ERS = Equivalent Rotative Speed**

**N = Total number of degrees per minute through  
which the bearing will rotate.**

$$ERS = \frac{N}{360}$$

In the above formula, allowance is made for the total number of stress applications on the weakest race per unit time, which, in turn, determines fatigue life and the speed factors. When the oscillation angle is very small, fretting corrosion can take place. The theory behind fretting corrosion is best explained by the fact that the rolling elements in small angles of oscillation retrace a path over an unchanging area of the inner or outer races where the lubricant is prevented by inertia from flowing in behind the roller as the bearing oscillates in one direction. Upon reversal, this small area of rolling contact is traversed by the same roller in the dry state. The friction of the two unlubricated surfaces causes fretting corrosion and produces failures which are unpredictable from a normal life standpoint. For applications with small angles of oscillation, it is recommended that it be reviewed with Application Engineering to select a bearing type that will help minimize potential fretting corrosion.

## Load Ratings and Life Continued

With a given bearing selected for an oscillating application, the best lubrication means is a light mineral oil under positive flow conditions. With a light oil, there is a tendency for all areas in the bearing load zone to be immersed in lubricant at all times. The full flow lubrication dictates that any oxidized material which may form is immediately carried away by the lubricant, and since these oxides are abrasive, further wear tends to be avoided. If grease lubrication must be used, it is best to consult with either the bearing manufacturer or the lubricant manufacturer to determine the best possible type of lubricant. Greases have been compounded to resist the detrimental effect of fretting corrosion for such applications.

### Static Load Rating

The “static load rating” for rolling element bearings is that uniformly distributed static radial load acting on a non-rotating bearing, which produces a contact stress of 580,000 psi for roller bearings and 609,000 psi for ball bearings, at the center of the most heavily loaded rolling element. At this stress level, plastic deformation begins to be significant. Experience has shown that the plastic deformation at this stress level can be tolerated in most bearing applications without impairment of subsequent bearing operation. In certain applications where subsequent rotation of the bearing is slow and where smoothness and friction requirements are not too exacting, a higher static load limit can be tolerated. Where extreme smoothness is required or friction requirements are critical, a lower static load limit may be necessary.

### Minimum Bearing Load

Skidding, or sliding, of the rolling elements on the raceway instead of a true rolling motion can cause excessive wear. Applications with high speeds and light loading are particularly prone to skidding. As a general guideline, rolling element bearings should be radially loaded at least 2% of Basic Dynamic Rating for roller bearings and 1% of Basic Dynamic Rating for ball bearings. For applications where load is light relative to the bearings dynamic load rating, consult Application Engineering for assistance.

# Load Ratings and Life Continued

## Computing Bearing Loads

In the computation of bearing loads in any application of a Regal Power Transmission Solutions unit, the principal factor determining the selection of the unit is the equivalent radial load to which the bearing will be subjected. These radial loads result from any one or any combination of the following sources:

1. Weights of machine parts supported by bearings.
2. Tension due to belt or chain pull.
3. Centrifugal force from out of balance, eccentric or cam action.

The resulting load from any one, or any combination of the above sources is further determined by knowing:

1. The magnitude of the load.
2. Direction of the load.
3. The point of load application.
4. The distance between bearing centers.

Bearing loads are the result of force acting on the shaft. Direction, magnitude, and location with respect to the bearings must be considered when calculating bearing loads. The following cases are typical examples of loads encountered and methods of calculating bearing loads.

**CASE #1**  
**Drive Load Calculation**

$$P = \frac{126,000 \times \text{HP}}{\text{RPM} \times d} \times K$$
 K = Apply P to Case 2, 3 or 4 if applicable  
 HP = horsepower  
 RPM = revolutions per minute  
 d = pitch of pulley in inches  
 K = constant for type of drive used  
 K = 1.5 for V-belts  
 K = 2 to 3 for flat transmission belts  
 K = 1.1 for chain drives

**CASE #2**  
**Cantilever and Drive**

Load on Bearing A =  $\frac{P_1 \times (a + k) - (P_2 \times b)}{k}$   
 $= \frac{200 \times (4 + 9) - (80 \times 2)}{9}$   
 $= 271 \text{ lbs.}$   
 Load on Bearing B =  $\frac{P_2 \times (k + b) - (P_1 \times a)}{k}$   
 $= \frac{80 \times (9 + 2) - (200 \times 4)}{9}$   
 $= 9 \text{ lbs.}$

**CASE #3**  
**Straddle, Cantilever Drive**

Load on Bearing A =  $\frac{P_1 \times (k + a) + (P_2 \times c) - (P_3 \times d)}{k}$   
 $= \frac{60 \times (12 + 2) + (180 \times 6) - (70 \times 4)}{12}$   
 $= 137 \text{ lbs.}$   
 Load on Bearing B =  $\frac{-(P_1 \times a) + (P_2 \times b) + P_3 \times (k + d)}{k}$   
 $= \frac{-(60 \times 2) + (180 \times 6) + 70 \times (12 + 4)}{12}$   
 $= 173 \text{ lbs.}$

**CASE #4**  
**Straddle Mount, Cantilever Drive**

Load on Bearing A =  $\frac{(P_1 \times b) - (P_2 \times c)}{k}$   
 $= \frac{(1000 \times 4) - (150 \times 3)}{11}$   
 $= 323 \text{ lbs.}$   
 Load on Bearing B =  $\frac{(P_1 \times a) + (c + k) \times (P_2)}{k}$   
 $= \frac{(1000 \times 7) + (3 + 11) \times (150)}{11}$   
 $= 827 \text{ lbs.}$

**CASE #5**  
**Vibrating Drives**

Load due to Centrifugal and Inertial Forces - In a shaker or gyrating screen bearing application, the load on the bearings is increased by sudden stopping, starting, and reversing of typically large loads. This can be expressed as a basic physical law:

**Force = Mass x Accelerations**

In order to use this law, we develop from it the following equation:

**F = .000341 x WR(RPM)<sup>2</sup>**

Where: F = Load of force in lbs.  
 W = Weight of rotating mass in lbs.  
 R = Radius of rotation or throw in feet  
 RPM = Shaft rotation in revolutions per minute

What is the centrifugal bearing load on a shaker screen which weighs 2,500 lbs., has a throw of 1/4 in. and whose shaft speed is 500 RPM?

**F = .000341 x 2,500 x  $\frac{.250}{12}$  x (500)<sup>2</sup> = 4,440 lbs.**

For more information on Bearing Basics, please contact Application Engineering (800) 626-2093.

# Lubrication

Proper lubrication is essential to achieving desired bearing life. Each bearing application creates individually different requirements for adequate lubrication. To assist in selecting the lubricant and lubrication method, the following information is furnished as a general guide. Generally, the assistance of a qualified engineering representative from a lubricant company should be enlisted. If specific recommendations are required for a particular application, consult Application Engineering.

## **Lubricants are used to:**

- a. Reduce friction and wear
- b. Reduce adhesion
- c. Provide a barrier to contamination
- d. Cool the moving elements
- e. Protect against corrosion

Adequate lubrication is necessary in the rolling-contact areas, on contacts between rolling element and retainer, on contacts between a roller end and flange and on other areas where sliding takes place. Lubrication is required to reduce galling, adhesion, wear, corrosion, scuffing, welding and pitting. Of primary importance is adequate lubrication of the rolling element (Hertzian) contacts to avoid reduction of bearing fatigue life. These heavily loaded areas between the rolling elements and raceways impose the most critical requirement on the lubricant and its properties.

Lubricants of too low an initial viscosity or those too sensitive to temperature changes may induce shallow spalls under conditions of high slip (as in misalignment) or may induce plastic flow of the contacting surfaces.

## **Lubricants are often limited by their ability to:**

- a. Replenish themselves
- b. Dissipate frictional heat
- c. Resist high environmental temperatures
- d. Remain stable under operating conditions

One important purpose of a lubricant is to prevent corrosion of the bearing surfaces engaged in rolling (Hertzian) contact. Many applications involve environments which allow water to accumulate in the bearing cavity. Whether from direct intake or condensation, moisture is detrimental and a lubricant must be selected to disperse the water or to prevent its attack on the metal since corrosion drastically reduces bearing life. Applications involving heavy loads and high operating temperatures also require careful approaches. Here extreme pressure (EP) lubricants should be used. High shaft speeds generally dictate lubricant selection based on the need for cooling, the suppression of churning or aeration of conventional lubricant and, most important of all, the inherent speed limitations of certain bearing types.

Elastohydrodynamic (EHL) lubrication is the model that explains the lubrication of anti-friction bearings. EHL takes into account the deformation of the rolling elements and raceways as well as the increased viscosity of the lubricant in the load zone.

## Lubrication Continued

In a rotating rolling element bearing there is one of three types of lubrication conditions present; 1) boundary, 2) thin film, 3) thick film. Bearing operating speed is an important element in determining the lubrication condition. Boundary lubrication occurs when there is metal on metal contact between rolling elements and races. This may be due to low speed and/or oil viscosity that is too low to separate the surfaces. Boundary lubrication is the most severe condition for antifriction bearings and distress of the rolling elements and races will occur. In the thin film condition, partial separation of the surfaces of the rolling elements and races occur with some asperities in contact. This condition may be due to low speed and/or oil viscosity too low to separate the surfaces completely. Some distress of the bearing surfaces will take place in thin film lubrication. Thick film lubrication is the preferred condition for optimum bearing performance. The speed of the bearing and/or the lubricant viscosity is sufficient to separate the rolling elements and raceways. Higher viscosity oils (or higher operating speeds) can help to attain the thick film lubrication condition, but excessively high oil viscosities may lead to higher operating temperatures from churning of the oil or skidding of the rolling elements. Lower viscosity oils sufficient to attain a thick film lubrication condition at the operating speed are selected in high speed applications as they have less tendency to churn or cause skidding.

### Grease Lubrication

Greases are applied where fluid lubricants cannot be used because of the difficulty of retention, relubrication, or because of the danger of churning. Rolling contact bearings are often grease lubricated because grease is easier to retain in the housing over a longer period than oil and grease acts, to some extent, as a seal against the entry of dirt and other contaminants into the bearing. Greases are usually made by using soap or other inorganic compounds to thicken petroleum or synthetic oils. The thickener is used to immobilize the oil, acting as a reservoir to release the oil at a slow rate. Though the thickener may have lubrication properties itself, the oil bleeding from the bulk of the grease is felt to be the determining factor. When the oil has depleted to approximately 50% of the total weight of the grease, the lubricating ability of the grease becomes doubtful.

Greases are divided into grades by the NLGI (National Lubricating Grease Institute), ranging from 0, the softest, up through 6, the stiffest. The grade is determined by testing a penetrometer, measuring the depth of penetration of a specific weighted cone. Most greases have thixotropic properties (they soften with working) and, as such, must be considered for their worked properties rather than in the “as-received” condition. Conversely, many greases are found to stiffen when exposed to high shear rates in automatic grease dispensing equipment.

To limit shock loads and settling, grease-lubricated bearing housings should have dividers or seals to keep the bulk of the grease in place. Grease lubrication depends on a relatively small amount of mobile lubricant (the oil bled out of the bulk) to replenish that thrown out of the bearing during operation. If the space between the bulk of the grease and the bearing is too large, then a long delay (determined by the grease bleed rate and its temperature) will be encountered before lubricant in the bearing is resupplied. This delay may affect bearing life.

Grease is normally applied with the material in the cavity contacting the bearing in the lower quadrant for bearings mounted on horizontal shafts. The initial action of the bearing when rotated is to purge itself of excess grease and to clear a path for bleed oil to enter the bearing. Therefore, greases selected are often of an NLGI grade 2 or 3 consistency, referred to as the “channeling” variety.

# Lubrication Continued

Grease usually consists of three primary components: oil, thickener, and additives.

Oil is the primary lubricating component in grease and consists of two types: petroleum and synthetic. Petroleum oils are the primary oils used today. Synthetic hydrocarbons can be thought of as synthetic petroleum oils. Other synthetics include esters, silicones, fluorinated hydrocarbons, etc.

Oil is a fluid and can be obtained in varying viscosities. Viscosity refers to the “thickness” of the oil and is usually directly related to an oil’s shear strength or its ability to resist loading. Selection of oil viscosity for rolling element bearing applications is normally dependent on bearing size, speed, load and operating temperature. Method of lubrication may also affect the selected oil viscosity. With these factors known, selection of proper oil viscosity can be made on the basis of elastohydrodynamic analysis, which can be provided by Application Engineering.

The thickeners primary purposes are to retain the oil so that it remains in the bearing, release the oil as needed, and reabsorb the oil as needed. The thickener can also provide additional sealing and protection from contamination and heat dissipation. There are many types of grease thickeners including lithium, calcium, sodium, aluminum, polyurea, etc.

## Lithium Soap Grease

For grease lubrication, lithium soap base greases are most common. They are preferred for needle bearings in general because of their ability to stand up under churning action of rollers in a confined space. These greases are not channeling types, therefore provide constant lubrication for roller contact surfaces. They are also insoluble in water. Typical operating temperature range is approximately -30°F to +250°F (-35°C to +120°C).

## Sodium Soap Grease

Sodium soap greases are suitable for many applications since they do have a relatively broad useful operating temperature range. However, they are generally restricted to the lower operating speeds because they are typically fibrous and more adhesive than other grease types. Because of this, they resist throw-off, but the fibrous texture causes higher operating temperatures than lithium or calcium soap greases. Very small amounts of water can be absorbed by sodium soap greases, which may be an advantage in some applications; however, this type grease will be washed away if excessive water is present. Typical operating temperature range is approximately -5°F to +200°F (-20°C to +93°C).

## Calcium Soap Grease

Calcium soap greases are typically used because they are water resistant. They are smooth textured and have good mechanical stability, but are limited to lower operating temperatures than lithium or sodium soap greases. Typical operating temperature range is approximately -5°F to +150°F (-20°C to +65°C).

# Lubrication Continued

## Polyurea Thickened Grease

Polyurea thickened greases are smooth textured with good mechanical stability. They exhibit very good oxidation and water resistance properties. Oxidation resistance makes this grease type suitable for higher operating temperatures. Typical operating temperature range is approximately -30°F to +350°F (-35°C to +175°C).

## Bentonite or Clay Thickened Grease

These smooth textured greases have very good heat resistance, as the thickener will not melt. They are limited by the base oil temperature properties. Operating temperatures up to +350°F (+175°C) are typical, with intermittent operation up to +450°F (+230°C) sometimes possible. Low temperature properties are satisfactory. However, this type is often formulated with a high oil viscosity for high temperature. Such formulations may not be suitable for low temperature applications.

Greases also can also contain additives. These additives may increase load capacity, resist corrosion, resist temperature extremes, resist oxidation, affect oil viscosity, thickener consistency characteristics, as well as many other characteristics.

Consult Application Engineering when using EP additives or other solid additives such as molybdenum disulfide, graphite, brass, nickel, etc.

## Food Grade Grease

“Food Grade” grease may be desirable in applications that are within close proximity to food production. “Food Grade” grease is an option in most Regal Power Transmission Solutions bearing products. Please consult Application Engineering for current specifications.

## Reduced Maintenance

Some bearings offered by Regal Power Transmission Solutions have features which can help extend bearing operating life and therefore are not provided with provisions for relubrication. This type of bearing may have an operating life limited by the life of the original grease fill and the ability of the seals to protect the bearing from contamination. Regal Power Transmission Solutions has many seal and grease options for reduced maintenance bearings. Further information for these offerings can be found in the respective bearing type Engineering sections.

## High Temperature Grease

High temperature grease options are available for most Regal Power Transmission Solutions bearings. Consult Application Engineering for a suggested lubricant for your application. Higher operating temperatures can also affect required lubrication interval. Refer to the lubrication interval information in the respective bearing type Engineering section.

## Lubrication Continued

### Grease Compatibility

Combinations of greases with different thickeners can result in a mixture having poorer performance or physical properties than the individual components. Incompatibility can also result from other than different thickeners. Because grease is a combination of thickener, oil and additives, it is also possible that any of these components may be incompatible with those of the other grease. Therefore caution should be used when relubricating with or combining different greases. Contact Application Engineering for current grease specifications. Contact your grease manufacturer for grease compatibility.

Petroleum oils and synthetic hydrocarbons are, generally speaking, compatible. Other synthetic oils are, more often than not, incompatible with other oils.

Additives may cause compatibility problems in some cases. Caution should be used when relubricating with or combining different greases. Contact Application Engineering for current grease specifications and your grease manufacturer to verify grease compatibility.

### Oil Lubrication

Oil lubrication is normally used when speeds and temperatures are high or when it is desired to have a central oil supply for the machine as a whole. Cooled oil is sometimes circulated through the bearing to carry off excess heat resulting from high speeds heavy loads. Oil for anti-friction bearing lubrication should be well refined with high film strength, good resistance to oxidation and good corrosion protection. Anti-oxidation additives are generally acceptable but are of significance only at higher operating temperatures (over 185 °F). Anti-corrosion additives are always desirable.

Since oils are considerably more uniform in their characteristics than greases, their selection is much easier. The primary requirement, following viscosity, is a high grade mineral oil — not animal or vegetable oils which have a tendency to deteriorate. The oil must be resistant to oxidation, gumming and evaporation so that viscosity assumes the important role. For extremely low starting temperatures, an oil must be selected which has a sufficiently low pour point so the bearing will not be locked by stiff oil. The oil level should normally be maintained at the center of the lower-most rolling element when the bearing is stationary. An over supply of lubricant causes excessive churning action and can lead to heat generation. Oils of varying viscosity may be selected, depending on application conditions. Selection of oil viscosity for rolling element bearing applications is normally dependent on bearing size, speed, load and operating temperature. Method of lubrication may also affect the selected oil viscosity. With these factors known, selection of proper oil viscosity can be made on the basis of elastohydrodynamic analysis, which can be provided by Application Engineering. A general rule is to maintain the following lubricating oil viscosities for the respective bearing types at the bearing operating temperature.

Product	Viscosity at Operating Temperature
Ball	70 SUS (13 cSt)
Needle and Spherical Roller	100-150 SUS (30 cSt)
Cylindrical Roller	110 SUS (23 cSt)
Cylindrical Thrust	125 SUS (26 cSt)
Tapered and Tandem Thrust	160 SUS (34 cSt)

# Lubrication Continued

## Oil Lubrication Systems

This method of lubrication is generally applicable to unmounted bearing products. The lubrication system must provide each roller bearing with a uniform, continuous supply of clean oil and must satisfy the cooling requirement of the bearing. Oil lubrication systems are also designed to meet the following needs:

- a. Adaptability to function over the range of variables encountered in the operating regime
- b. Reliability in a given operating environment and over the length of the normal maintenance periods
- c. Maintainability
- d. Overall ability to meet the requirements of the system application
- e. Relative cost when compared to the cost of machine or application

The table below provides a list of commonly used lubrication systems and shows some of the significant features that must be considered in their design and selection for roller bearing applications.

Lubrication System	Initial Cost	Required Maintenance	Oil Flow	Cooling	Reliability	Sensitivity to Environmental Changes	Sealing Requirements
Manual	Low	High	Variable and dependent on worker for continuity	Minimal and variable	Poor	Highly adaptable	Not Significant
Drip Feed	Low	Contingent upon type of service and location of lubrication points	May vary with time	Low	Average	May be affected by temperature variations	Not Significant
Splash	Dependent on Design	Negligible	Dependent upon maintenance of oil level in housing	Fair	High	Sensitive to low temperature. may accumulate moisture due to condensation	Generally critical
Wick Feed	Low to Medium	Medium	Uniform, filtered, continuous	Negligible	High, if wick is maintained	Sensitive to low temperature	Not Significant
Pressure Circulating System	High	Medium	Controlled and continuous. Adding filtration ensures clean oil supply	Excellent, can include heat exchanger	High	May accumulate moisture due to condensation	Important
Air-Oil Mist	High	Medium	Positive, automatic delivery of regulated oil quantity, free of contamination	Excellent	High	Sensitive to low temperature	Important

# Lubrication Continued

## Lubrication Frequency

Lubrication frequency is dependent on application speed, temperature, and level of contamination. Relubrication schedules are only general recommendations. Experience and testing may be required for specific applications. Check individual product sections for more information on specific Regal Power Transmission Solutions product lubrication guidelines.

## Solid Lubricants

Oil saturated polymers (OSP) are generally a porous plastic that retains oil and are used in place of grease. This option may be used in inaccessible areas where relubrication is difficult. Oil is released during bearing operation and excess oil is reabsorbed when operation stops. Since the polymer material fills the bearing cavity, it also helps to keep out contaminant. This product is generally limited to slower operating speeds and generally to temperatures below +200°F (+93°C).

Graphite is another form of solid lubrication. A semi-solid graphite mixture is inserted into the bearing and then baked to cure the material. Lubrication comes in the form of a thin layer of solid graphite that is deposited on all friction surfaces. This type of lubrication works well in extreme temperature (high or low), high contamination, or even when the bearing is submerged (lubricant does not have anti-corrosion properties).

## Dry Film

Dry film lubricants such as molybdenum disulfide or graphite are well suited for specialized applications such as: high temperature, oscillatory rotation, maintenance free operation, or locations where bearings cannot be reached for easy maintenance. The lubricant is applied as a thin film and is permanently bonded to the bearing surfaces. The interaction of the rolling elements with this solid lubricant works to compact the lubricant into the surface imperfections of the bearing elements and reduces metal-to-metal contact.

# Mounting

Mounting the bearing has important effects on performance, durability and reliability. Proper tools, fixtures and techniques are a must for any bearing application, and it is the responsibility of the design engineer to provide for this in his design, advisory notes, mounting instructions and service manuals. Nicks, dents, scores, scratches, corrosion staining and dirt must be avoided if reliability, long life and smooth running are to be expected. This section is provided as a reference only, additional data dealing solely with each type of bearing is found in each respective section.

Fit selections given in the various sections will serve as a guide for the majority of applications where the bearings are subjected to normal or heavy loads and other normal operating conditions. When bearings are subjected to very heavy or vibratory loads it may be necessary to employ shaft and housing fits tighter than standard. The same applies if shafts or housings of soft metal or those not having smoothly ground bearing seats (i.e., the smoothness ordinarily associated with ground or reamed bores) are used. Furthermore, if speeds are abnormally high, it may be necessary to maintain shaft and housing fits other than those shown in tables. Consult Application Engineering for recommendations for these abnormal conditions.

## Shaft Fit – Mounted Product

Most mounted bearings are used to provide rotational support by inserting a shaft through them, typically with a slip fit. The shafts tolerance and finish is of utmost importance for proper bearing function and useful life. Ground shaft finishes are normally suggested for most applications; however, in some cases, a ground finish is not practical. In these situations, a machined finish may be acceptable; consult Application Engineering for recommendations. Additional shaft requirements dealing solely with each type of bearing are found in each respective section.

## High Load Applications – Mounted Product

Applications where the loading approaches the load listed in the respective mounted product's rating table at 5000 hours life and 150/250 rpm should be reviewed and given special consideration. Modifications to consider include:

- Shaft size should be closely controlled for a line to line to a light press fit.
- Skwezloc® Locking Collar or double lock is the preferred lock system.
- Lubricants with "EP" extreme pressure additives may be required.
- Care in housing selection, load direction, and mounting techniques should be exercised. Refer to respective mounted product's installation instructions.

## High Speed Applications – Mounted Product

Applications where the speed is in the range of 80% to 100% of the maximum speed listed in the respective mounted product's rating table should be reviewed and given special consideration. Modifications to consider include:

- Shaft size should be controlled to specifications listed in the installation section.
- Skwezloc Locking Collar or double lock is the preferred lock system.
- High quality lubricants should be used.
- Grease should be added more frequently and in small amounts. Refer to respective mounted product's relubrication schedule.
- Care in mounting techniques should be exercised. Refer to respective mounted product's installation instructions.

# Mounting Continued

## Shaft Fit – Unmounted Product

The slipping or creeping of a bearing race on a rotating shaft, or in a rotating housing, occurs when the fit is loose. Such slipping or creeping action can result in rapid wear of both the shaft and bearing races when the surfaces are dry and heavily loaded. To help prevent this, the bearing is customarily mounted with a press fit on the rotating race and a push fit on the stationary race with the tightness or looseness dependent upon the service intended. Bearings should be mounted squarely when press fitted, either in housings or on shafts, and installation pressure should be applied to the press fitted member only, or should be evenly distributed over both members. Where shock or vibratory loads are to be encountered, fits should be made tighter than for ordinary service. When heavier shaft fits are encountered, the assembly of a bearing on a shaft is best done by expanding the inner race by heating. Heat should not be applied directly to the bearing, but should be conducted to the bearing by some fluid medium. It is recommended that such heating be accomplished in clean mineral oil or in a temperature-controlled furnace at a temperature of between 200°F and 250°F as overheating will reduce the hardness of the races. Sealed bearings should not be mounted by this method as the grease with which the bearings are prelubricated may be affected.

## Housing Fit – Mounted Product

For mounted bearing product (pillow blocks, flange blocks...) proper housing fit is dependent on bearing application variables: amount of shock/vibration, high speed fan applications, and need for low torque self-aligning capabilities. Applications with high shock and vibration require tighter fits between the bearing insert and the housing. Shock and vibration work to loosen the fit over time so it is best to start with tight fits. Fan applications require a loose fit to allow for easy self-aligning capabilities to adjust for variations in mounting surfaces that are typically found in air handling mounting structures.

## Housing Fit – Unmounted Product

These types of bearings will be mounted into the customer's housing and therefore is application dependent. In the case of unmounted roller bearings or ER style bearings, housing fit is dependent on whether the outer ring is stationary or rotating. In general, a rotating outer ring requires a tighter fit than if the outer ring is stationary. In applications where bearing housings are made of soft materials (aluminum, magnesium, light sheet metal, etc.) or those which lose their fit because of different thermal expansion, outer race mounting must be approached cautiously. First, determine the possible consequences of race loosening and turning. The type of loading must also be considered to determine its effect on race loosening. The force exerted by the rotating elements on the outer race can initiate a precession which will aggravate the race loosening problem through wear, pounding, and abrasion. Since the pressing force is usually greater than the friction forces in effect between the outer race and housing, no foolproof method can be recommended for securing outer races in housings which deform significantly under load or after appreciable service wear. The surest solution is to press the race into a housing of sufficient stiffness with the heaviest fit consistent with the bearing operating clearances. Often, inserts or liners of cast iron or steel are used to maintain the desired fit and increase useful life of both bearing and housing. When stationary outer rings are required to float (move axially in the housing bore to compensate for expansion), a housing bore surface finish of 65 micro inches Ra maximum is recommended.

## Mounting Continued

### Housing Fit – Cam Follower

Proper mounting of stud type cam follower and track roller bearings requires a close fit between the bearing stud and the housing hole. The endplate must be backed up by the housing member face. Likewise the face of the housing adjacent to the bearing endplate face should be square to the housing bore.

Endplate support is also critical when mounting yoke-type series cam followers and track rollers. If the endplates are not properly backed up, they can partially or completely work off the inner ring. The preferred mounting method is by use of a separate bushing at one side to permit complete axial clamping of the endplates. If the endplates can not be clamped end-wise, it is essential to have a close fit axially in the yoke in which the bearing is mounted to prevent the bearing endplates displacing axially. Refer to the Camrol engineering section for more detailed information regarding cam follower mounting.

### Mounting for Precision and Quiet Running Applications - Radial Cylindrical Roller Bearings

In applications of roller bearings where smoothness of operation is important, special precautions must be taken to eliminate those conditions which serve to initiate radial and axial motions. Accompanying these motions are forces that can excite bearing system excursions in resonance with shaft or housing components over a range of frequencies from well below shaft speed to as much as 100 times above it. The more sensitive the configuration, the greater the need for precision in the bearing and mounting. Among the important elements to be controlled are shaft, race, and housing roundness, squareness of faces, diameters, and shoulders. Though not readily appreciated, grinding chatter, lobular out-of-roundness, waviness and any localized deviation from an average or mean diameter (even as a consequence of flat spots as small as .0005 in.) can cause significant operating roughness. To detect the aforementioned deficiencies and ensure the selection of good components, three-point electronic indicator inspection must be made. For ultra precise or quiet applications, components are often checked on a continuous recording instrument capable of measuring to within a few millionths of an inch. Though this may seem extreme, it has been found that shaft deformities will be reflected through the bearings' inner races. Similarly, tight-fit outer races pick up significant deviations in housings. Special attention is required both in housing design and in assembly of the bearing to shaft and housing. Housing response to axial excursions forced by bearing wobble resulting from out-of-square mounting has been found to be a major source of noise and howl in rotating equipment. Stiffer housings and careful alignment of bearing races make significant improvements in applications where noise or vibrations have been found to be objectionable.

### Squareness and Alignment - Radial Cylindrical Roller Bearings

In addition to the limits for roundness, squareness of end faces and shoulders must be closely controlled. Tolerances of .0001 in. full indicator reading per inch of diameter are normally required for shoulders, in addition to appropriately selected limits for fillet eccentricities. The latter must also fall within specified limits for radii tolerances to prevent interference with bearing race fillets, which results in cocking of the race. Reference should be made to the individual bearing dimension tables, which list the corner radius for each bearing. Shoulders must also be of sufficient height to ensure proper support for the races.

## Rollway Cylindrical Roller and McGill Spherical Roller Bearings – Shaft and Housing Seat Diameters

The tolerances, specified in the following charts for shaft and housing bearing seat fits, may be followed for specific application conditions that are encountered, as indicated. For special applications not covered by the following, Application Engineering should be consulted for additional assistance. The proper shaft and housing seat tolerances are designated by a letter and number. For shafts, a lower case letter is used, and for housings, a capital letter, both indicating the location of the tolerance range in relation to the nominal bearing dimension. The numbers indicate the grade of accuracy.

**Housing Seat Fits**

Housing Construction	Operating Conditions		Fit Symbol*	
Housing not split radially	Housing rotating relative to load direction	Heavy loads on bearing in thin wall housing	P7	
		Normal and heavy loads	N7	
		Light loads	M7	
	The direction of the load indeterminate	Heavy shock loads		
			Heavy and normal loads axial displacement of outer ring not required	K7
Housing split or not split radially		Normal and light loads axial displacement of outer ring desirable	J7	
		Shock loads, temporary complete unloading		
	Housing stationary relative to load direction	All loads	Housing not split radially	H7
			Housing split radially	H8
		Heat supplied through the shaft	G7	

\* For cast iron or steel housing.

For housings of light metal, tolerances are generally selected that give slightly tighter fits than those shown.

# Internal Clearance

## Radial and Axial Internal Clearance

Anti-friction bearings are manufactured with specific radial clearances between the raceways and rolling elements. The clearances are designed for normal operating temperatures and application conditions. Certain bearing products, such as spherical roller bearings, are available with industry standard radial clearance ranges. Other bearing products will incorporate radial clearance as determined by the manufacturer. For high temperature and high speed applications, increased radial clearance options may be available to allow for thermal expansion. For mounted bearings exposed to high shock load and vibration, reduced internal clearance may be an option to distribute load over more rolling elements and reduce the stress per rolling element. Oscillatory applications may also benefit from reduced internal clearance. Load is carried over more rolling elements thus putting less stress on bearing raceways and potentially reducing wear.

Axial clearance between rolling elements and raceways also allows an inherent axial movement within the bearing, this is known as end play. End play, is the maximum relative displacement of the bearing rings relative to one another, in a direction parallel to the axis of rotation. The amount of endplay in a given bearing product is based on the design experience of the manufacturer and partly controlled by manufacturing tolerances.

## Bearing Stiffness

Bearing stiffness is the relationship between bearing load and bearing deflection due to that load. Bearing stiffness is dependent on several variables: rolling element type, contact angle, applied load, and bearing preload.

Rolling element type comes into play due to the different contact patterns that the rolling elements make with the raceways. Therefore roller bearings, with their large line contact, will be stiffer than the point type contact produced by ball bearings. Additionally, the greater the number of rolling elements within the bearing the stiffer it will be.

Contact angle affects whether a bearing has better radial or axial stiffness. A small contact angle will produce a bearing with higher radial stiffness while a large contact angle will create higher axial stiffness.

Preload increases stiffness by removing internal clearance which in turn puts more rolling elements in contact with the raceway. As a negative affect, preload can increase operational temperatures and internal friction which can lead to reduced bearing life.

For specific information concerning stiffness data related to Regal Power Transmission Solutions bearings, please contact Application Engineering.

# Bearing Materials

A portion of bearing life and reliability of a rolling element bearing is based upon the material that the bearing components are made from. L10 bearing life equations are based upon the fatigue limit of the metal surfaces, both raceways and rolling elements. Therefore the proper and highest quality materials must be used.

## Through-hardened Steels

52100 is the most common type of through-hardened steel used for bearing components as it is widely recognized as a superior bearing steel. It is resistant to shock loading and carries high metal fatigue life ratings. In addition, Regal Power Transmission Solutions specifies all steel to be vacuum degassed (VDG). This is an extra manufacturing operation to filter impurities and remove inclusions that often appear during steelmaking. The result is a cleaner and more pure material that is better able to withstand subsurface cracking and subsequent premature metal fatigue failures.

Some bearing product produced using 52100 utilizes a zone hardening process in which only the raceway and immediate area is hardened. This creates a hardened surface for rolling elements but ductile in other areas for improved durability and shock load resistance.

## Case-hardened Steels

Case hardening is used for certain applications when a through hardened part is undesirable. The surface can be hardened to an acceptable level yet the core of the part remains soft to resistant vibration and impact loads.

8620, 4118 and 9310 are examples of case hardening steel used by Regal Power Transmission Solutions for bearing components. These low carbon alloy steels have good hardenability characteristics and toughness when properly carburized and hardened.

## Corrosion Resistant Steels

A variety of corrosion resistant steels are used across the Regal Power Transmission Solutions bearing line. The type of steel used depends on the component, cost effectiveness, and level of corrosion resistance needed.

The most common steel used for corrosion resistant bearing products is 400 series stainless steel. Its corrosion resistance is less than austenitic grades but it can be heat treated to obtain acceptable hardness value needed for anti-friction bearings.

300 series stainless steel is the most common type of stainless steel used for consumer products. It has excellent corrosion resistance when compared to 440C or coatings. However it cannot be hardened to acceptable levels for use in bearings. Therefore it can only be used in certain areas of bearing design that do not see a direct load from rolling elements. This includes components such as housings, seal stampings, setscrews, grease fittings, etc.

Standard bearing steels can also be coated or plated with various substances to provide good corrosion resistance as well as good harness values.

# Bearing Materials

## High Temperature Steels

As temperature rises, bearing rating is reduced, depending upon the bearing material and the operating temperature. Various types of tool steel, stainless steel and some of the more exotic materials are being used in order to meet the need for bearings to operate at elevated temperatures.

Bearing applications involving elevated temperatures preclude the use of standard bearing materials if full capacity is to be realized. In general, the temperature range is divided as follows:

- 250°F to 400° F
- 400°F to 800°F
- Over 800°F

Applications in range (a) can be generally handled by standard alloy steels , such as SAE 52100 or carburized SAE 8620 , suitably hardened and stabilized for the range of operating temperature . Little or no reduction in basic capacity should be expected. For range (b), high alloy tool steels (M-50) may be used. For range (c), materials such as ceramics are generally required. Design options in this range are generally limited.

## Composites – Bushings

Replacing rollers, a non-metallic bushing provides load support and a sliding motion that eliminates or reduces need for bearing lubrication. Recommended for use where relubrication is not convenient or where the possibility of grease contamination of the product being processed is not acceptable. Application limitations are lighter loads and lower speeds when compared to a rolling element bearing.

McGill bushing type CAMROL® bearings have a maximum allowable continuous operating temperature of 200°F (120°). The bushings are intended to be used in the self-lubricated mode. However, continuous feed oil lubrication can be used to provide reduced wear rates. Grease lubrication should not be used.

# Housing Material

A variety of housing materials are offered within the Regal Power Transmission Solutions mounted bearing product line. Selection of proper materials is application dependent and based upon variables such as type of loading, cost, and environmental conditions.

Gray iron, or cast iron, is the most common housing material type and has adequate strength for most applications. However, certain application conditions must be considered. Cast iron can be a brittle material when higher tensile (pulling) forces are applied; therefore it is not recommended in applications where shock loads are present.

Ductile iron or cast steel is preferred in applications with heavy loads, shock, and vibration since these materials have higher tensile strength and ductility. The chart below shows a comparison of housing materials and their tensile strengths. There is a slightly higher cost associated with ductile iron and cast steel housings and availability may be limited depending on product line.

In applications where there is significant humidity, moisture or chemicals present there is a likelihood that corrosion may occur over time. A coating or alternative material maybe required to meet material performance or customer aesthetic requirements. For each product line, Regal Power Transmission Solutions can offer an alternate coating or material to improve corrosion resistance. Refer to each product section or the Corrosion Resistant Engineered Solutions (CRES) section K for more details on available options.

# Seal Selection

The purpose of seals on a bearing is to help keep contamination from entering the bearing and to help retain lubricant inside the bearing cavity. Proper seal selection is dependent on a number of application variables: operational speed, level of contamination, type of contamination, operational temperature, and type of lubricant used.

## Seal Type

### Non-contacting/ Labyrinth Seals

Recommended for use in dry, low contamination environments. Constructed from multiple metal stampings, typically with one element that rotates with the shaft, creating a centrifugal force to help keep out contamination. Excess grease purges from the seal to help remove contaminants caught in the lubricant and prevent seal damage from over lubrication. These types of non-contact seals save energy by reducing drag and normally cannot be blown by over greasing.

### Contacting Seals

Contacting seals can be used in a variety of applications depending on type of seal and material used. These factors affect the type and severity of contamination that the seal can withstand.

### Felt Seal

The design incorporates a series of passageways with a highly effective filtering media that together block the ingress of contaminants and allow for the purging of oxidized grease during re-lubrication. Protective metal flingers are primary factors in seal performance. The inner flinger is pressed into the outer race and is a stationary foundation for the sealing system. The outer flinger, the first barrier to contaminant entry, is attached to the inner race and therefore rotates with the shaft. The rotation of the outer flinger offers two significant benefits. The first is the creation of a centrifugal force that repels debris by “slinging” it away from the seal area. The second is an extension of the flinger internally into the bearing chamber that initiates a vortex that churns the lubricant back toward the ball path. The design operates with less drag and less heat generation than rubber contact seals.

Recommend for use in dry applications with light to moderate contamination. Standard felt seals can operate in temperatures up to 200°F (93°C). Nomex felt can be used for temperatures 200°F to 400°F (93°C to 204°C).

### Rubber Lip

Positive contact molded rubber lip seal with or without an auxiliary flinger. This type of seal functions well in wet and dirty environments up to 250°F (120°C). High temperature versions are available for conditions up to 450°F (232°C). Multiple lip seals are also available for severe applications. Rubber lip seals come in a variety of materials: Buna N Nitrile, FKM, and silicone.

## Seal Selection Continued

### Spring Loaded

This V-shaped rubber seal is molded into a metal stamping. A spring is retained in the body of the “V” to maintain constant pressure against the inner race over the life of the seal. Seal lip can be oriented inward for increased lubricant retention. For better exclusion of contaminants the lip is oriented outward. High temperature versions available.

### V-Ring

The rubber contact face seal is designed to retain lubricant and help exclude contaminants. The seal is designed with a long flexible face that seals axially against the counterface. The contact seal is self purging. It retains low torque characteristics and rotates with the shaft to help reduce contaminate build-up on the seal. Its low friction reduces heat generation and wear.

## Bearing Retainers

The function of a bearing retainer (cage) is to separate the rolling elements at evenly spaced intervals and reduce internal friction which allows for increased speeds. In roller bearing product the retainer also provides stability to the rolling elements, keeping them from skewing as they rotate. Retainers are sometimes omitted and a full complement of rolling elements is used instead. Additional rolling elements help to add rigidity and increase static capacity.

In some cases use of retainers can also help in aiding longer bearing life. A retained bearing has a larger grease reservoir than a similar bearing that is a full complement.

### Mounted Ball

#### Land Riding

A land riding is design used in Sealmaster mounted ball product. This design minimizes friction and provides maximum grease circulation. Retainer is designed to “float” on the ground extension (or lands) of the outer ring while spacing the balls precisely for more even load distribution. This minimizes wear on both balls and retainer, while maximizing stability, especially important in applications involving vibration, shock loading or high operating speeds. For applications involving high temperatures, +220°F, land riding brass retainers are available.

#### Ball Riding

Ball riding retainers are designed to retain the balls within the cage pockets, which improves manufacturability, but can wipe oil away from the rolling elements removing it from these critical components. Sealmaster Material Handling Bearings and Browning Mounted Ball Bearing utilize a one piece ball riding nylon retainer molded from nylon 6/6. Nylon retainers a low cost alternative to brass retainers that have many good characteristics: low friction, natural lubricity, and resistant to many chemicals. Nylon retainers are capable of continues use up to 250°F, but many other components in the bearing may prevent. Some manufactures utilize a steel riveted ball riding retainer.

### Mounted Roller

#### Stamped Steel

A one-piece, low carbon steel stamping. This type of retainer provides roller guidance as well as retaining rolling elements with the inner ring.

## Bearing Retainers Continued

### Unmounted Roller – McGill

#### Stamped Steel Retainer – SPHERE-ROL

One-piece, low carbon steel stamping. Land riding design only provides roller spacing and helps provide greater speed capability.

#### Stamped Steel Retainer – CAGEROL

One-piece, low carbon steel stamping. Retains and spaces the rollers. Provides roller guidance to prevent skewing. Allows for an increased lubricant reservoir. Minimizes radial play of rollers to ease assembly. Helps provide higher speed capability.

#### Stamped Steel Retainer – Metric CAMROL

One-piece, low carbon steel stamping. Retainers are heat treated to allow for roller guidance. The retainers are designed with two rollers per pocket (except 13, 16, and 19mm OD's) to help maximize static and dynamic load ratings, yet still offer the advantages of a caged construction.

Note: Inch CAMROL is a full complement bearing design that does not utilize a retainer.

### Unmounted Roller - Rollway

#### Stamped Steel Retainer

A one-piece, low carbon steel stamping. Supplied on some bearings with snap ring retention. (TRU-ROL numbering suffix of "B") Recommended for low speed operations.

## Bearing Retainers Continued

### Segmented Steel Retainer

A built-up type of retainer utilizing low carbon steel segments rigidly held between stamped, low carbon steel end plates. This is the standard retainer supplied with commercial bearings identified with the TRU-ROL numbering system. Recommended for moderate speed applications.

### Two-Piece Retainer

This type of retainer is fabricated from brass. This is the standard retainer supplied with Rollway bearings identified with the MAX numbering system, ISO numbering system, TRU-ROL numbering system when the "MR" suffix is used, and any bearing with bore size over 180mm. Recommended for moderate to high speed applications.

### One-Piece Retainer

This land piloting retainer is fabricated from brass or steel with radial retention of the rollers provided by closing the roller "pocket" with small projections formed by mechanically upsetting the retainer material. This retainer design is typically made to order for high speed applications, though it is applicable for other applications.

### Cylindrical Thrust - Machined Brass

Thrust bearing retainers are machined from centrifugally cast brass. The retainers for all cylindrical roller thrust bearings are designed to be roller riding. The contoured roller pockets are accurately machined at right angles to the thrust force, which will be applied to the bearing. The rollers are retained in the assembly by a steel ring pinned to the outside diameter of the retainer.

### Tapered Thrust - Machined Brass

Taper thrust bearing retainers are machined from a single piece of centrifugally cast brass. The retainer is designed to pilot on the thrust plates' flanges. The roller pockets are accurately machined at right angles to the thrust force which will be applied to the bearing. The T-Flat retainers are "pin through" style (pins extend through the center of the roller). The retainer consists of two steel rings through which the hardened steel pins are secured. An alternate design is a retainer machined from a single piece of centrifugally cast brass with the rollers retained by two pins.

## Bearing Storage

Cleanliness and accuracy are stressed in all phases of bearing manufacture to help provide a clean and precise mechanical instrument. It is therefore essential the same care be taken in subsequent shipping, storage, and handling, as well as in mounting to make sure of the ultimate in bearing performance.

After completion, each bearing is thoroughly cleaned, preserved and packaged in a shipping carton with proper identification.

Lint-free commercial packing such as polystyrene foam packaging materials, crumpled newspaper or batting material may be used to cushion cartons of bearings in shipping containers. Materials having fine particulate, such as saw dust, are not recommended as such material may contaminate the bearings. The wrappings should never be removed from bearings until they are ready to be mounted. For those bearings preserved with a protective neutral compound, it is generally unnecessary to remove this coating as it will normally mix with any type lubricant.

When necessary to keep bearings in storage, they should be placed in a dry, cool location, and provision should be made to utilize the old stock before using new stock. Avoid dropping or other large impacts to the bearing as these forces will create damage to the bearing components and result in less than ideal bearing life.

## ABMA and ISO

### ABMA

These letters refer to American Bearing Manufacturers' Association - an organization comprised of the leading bearing and bearing-related manufacturers in the United States. The main purpose of the ABMA is to bring about standardization within the industry and to pass these benefits on to the bearing users.

### ISO

ISO is the name for the International Organization for Standards. ISO is a worldwide federation of national standards bodies. The mission of ISO is to promote the development of standardization and related activities in the world. ISO's work results in international agreements which are published as International Standards.

# Cam Followers

Unmounted bearing assembly consisting of hardened precision ground inner and outer raceways with either full complement or separated (cage) needle, ball, tapered or cylindrical rolling elements constructed with an integral stud or precision ground bore. Cam follower bearings provide an antifriction solution for translating rotation to linear motion or supporting either pure radial or combination thrust loads depending on the rolling elements types.

## **Bearing Configurations**

Cylindrical, Crowned, V-Groove Or Flanged

## **Mounting Styles**

Eccentric Or Concentric Stud Or Yoke

## **Outer Roller Diameter Range**

1/2" To 10" And 13 mm To 90 mm

## **Materials**

Bearing Quality Steel, Stainless

## Cam Follower Selection Guide

			SIZE RANGE

## McGill Inch Cam Followers

McGill CAMROL bearings are full complement needle bearings feature black oxide treated bearing steel, available in two basic mounting styles for use in mechanical automation or linear motion applications. Our basic features each contribute to improved performance, while the LUBRI-DISC<sup>®</sup> seal option helps prevent metal to metal contact within the bearing while providing a barrier for contaminant entry and allow venting of excess or old grease during relubrication. In addition to the seal option these bearings are available with several dimensional choices and combinations to provide a specific solution for the application. Within the following section you can learn more about these features and how they can be applied to your application.

McGill CAMROL bearings are manufactured from bearing quality steel with a black oxide finish and come factory filled with grease.

## Cam Follower Inch Nomenclature

## Features and Benefits

### Single Row Full Complement Needle Rollers

The needle roller diameter, length, and number have been optimized to provide a high dynamic and static load rating, contained within industry standard bearing envelope dimensions.

### Heavy Section Outer

The heavy section outer helps support radial loading and provide proper rolling element support.

### Cylindrical Outside Diameter (OD)

The cylindrical OD can improve performance in certain applications such as improved track capacity by maximizing the contact area with the track.

### Zone Hardened Raceways

Heat treatment used to precisely harden working surfaces of the raceway and flange. The hardened surfaces provide support for the rolling element contact stresses, while keeping the core of the inner ductile to help absorb shock loads.

## Features and Benefits continued

### Hardened Endplate

Similar to the flange, the endplate must provide a seal surface for the LUBRI-DISC seal and resist wear from incidental contact with the outer or rollers. The hardened and ground endplate provides a sealing surface with LUBRI-DISC<sup>®</sup> seal option.

### Factory Grease Fill

The cam follower and cam yoke roller bearings are factory lubricated with a medium temperature grease. Contact Application Engineering when application conditions require special lubricants.

### Lubrication Holes

Depending on mounting option, McGill stud type CAMROL bearings may include a lubrication hole to accept a standard drive fitting or an included oil hole plug. The oil hole plug is recommended for closing unused holes to help protect against bearing contamination or lubrication loss.

### Yoke Roller Lubrication Hole with Annular groove

McGill CAMROL Yoke roller bearings include a lubrication hole to provide a passage for lubrication to the rolling elements from the yoke roller bore. The customer supplied shaft must provide axial lubrication path to supply bearing. An annular groove in the inner ring bore helps direct lubricant to the hole, making alignment of the shaft and the inner ring holes less critical.

### Oil Hole Plug (s)

All McGill stud type Cam followers include 1-2 (depending on # of holes) oil hole plugs to help provide proper lubrication path to the rolling elements and prevent contamination from entering the bearing through an unused oil hole.

## Options

### Black Oxide Finish

Bearings have a black oxide finish on all external surfaces.

### LUBRI-DISC® Seal

The CAMROL standard for seals, the LUBRI-DISC seal helps keep contaminants out and lubrication in the bearing, with an integral back plate to separate the metal to metal contact between the outer ring and endplate(s) or flange. The back plate feature reduces friction resulting in lower operating temperatures which can extend grease life and allowing for higher operating speeds. The seal also includes vents to help prevent seal blowout during relubrication, while the outer raceway is machined with a reservoir for additional lubricant capacity. The LUBRI-DISC seal option has a good balance of sealing, lubricant capacity, and low drag operation essential to a precision cam follower suited for most industrial applications.

### Crowned Outside Diameter (OD)

A crown on the OD of a cam follower bearing can increase bearing life versus a standard cylindrical cam follower. The crown achieves this performance by helping to distribute the stress on the outer ring and rolling elements resulting from misalignment due to mounting inaccuracy or stud deflection. The crown also helps reduce outer skidding in turntable or rotary applications. Not all applications may see the benefit of a crowned OD, consult Application Engineering for guidance for your application.

### Heavy Stud Diameter

The increase stem diameter of heavy stud cam followers increases static load capacity of the bearing due to the larger stud diameter. The increase in diameter reduces the amount of deflection that can occur when cam followers are radial loaded. The resultant increase allows a maximum recommended loading of 50% BDR.

\*On Heavy-Stud Type Bearings, CFH inch series only

## Options continued

### Hex Hole (Broached)

The hex hole can aid in the installation and removal of stud type cam followers by increasing the holding power over a standard screw driver slot. The hex feature is identified with a "B" since it is produced using a broach process. Bearing relubrication from flange end must be considered for sizes under 3".

### Eccentric Stud

Eccentric stud option provides a means of adjusting the radial position of the bearing which can improve the load sharing of inline bearing combinations. Cam follower load sharing helps reduce operation costs by reducing premature failures due to overloaded bearings, the need of precise mounting hole location tolerances and providing ability to realign bearing due to track wear. Eccentric bushing is press fit on stud and unhardened to permit dowel or setscrew for permanent locking.

### Bushing Type

Non-Metallic bushing provides load support with a sliding motion that reduces the need for bearing lubrication for non-food applications where relubrication is not convenient or grease contamination in the process is not acceptable. Max allowable continuous operating temperature up to 200°F. Bushing CAMROL bearings are intended to be used in the self lubricated mode. However, continuous feed oil lubrication can be used to provide reduced wear rates. Grease lubrication should not be used.

### Corrosion Resistance

McGill CAMROL Cam Followers are available in 400 series corrosion resistant components for improved resistance to both external and internal corrosion. CRES CAMROL bearings are dimensionally interchangeable with standard CAMROL<sup>®</sup> bearings and easily identifiable with "CR" designation. Please see page K-3 for more information and availability.

## Additional Options

**BHT**  
Hex hole at threaded end of cam follower stud.

**THT**  
Threaded axial lubrication hole at threaded end of cam follower stud.

**THF**  
Threaded axial lubrication hole at flanged end of cam follower stud. Available with all screw driver slot cam followers or broached cam followers over 3”.

**THB**  
Threaded axial oil hole on both ends of cam follower stud. Available with all screw driver slot cam followers or broached cam followers over 3”.

**ALG**  
Annular lubrication groove at cam follower stud radial lubrication hole.

## **Custom Capabilities**

- *Customer specified factory grease fill*
- *Grease fitting installed*
- *Stud or thread length modifications*
- *Roller diameter variations or tolerances*
- *Cam followers grouped or matched diameter tolerance / run out sets*
- *Custom engineered to order designs*

# McGILL® Inch Cam Follower Bearings

- Basic Construction Type:** Stud Type Crowned / Cylindrical Outside Diameter
- Rolling Elements:** Full Complement Needle Roller
- Bearing Material:** Bearing Quality Steel
- Seal Type:** LUBRI-DISC®
- Lubrication:** Lithium Soap Grease NLGI #2
- System Configuration:** Concentric / Eccentric / Heavy Stud
- Mounting Feature:** Slot / Hex Hole

For positive clamping, use housing thickness equal to G dimension = .010".  
Clamping torque is based on dry threads. If threads are lubricated, use half of value shown.  
Hex wrench size for "Broached" version is located in the wrench size chart on page B-156.

# MCGILL® Inch Cam Follower Bearings

- Basic Construction Type:** Stud Type Crowned / Cylindrical Outside Diameter
- Rolling Elements:** Full Complement Needle Roller
- Bearing Material:** Bearing Quality Steel
- Seal Type:** LUBRI-DISC®
- Lubrication:** Lithium Soap Grease NLGI #2
- System Configuration:** Concentric / Eccentric / Heavy Stud
- Mounting Feature:** Slot / Hex Hole

For positive clamping, use housing thickness equal to G dimension  $\pm .010$ ".  
Clamping torque is based on dry threads. If threads are lubricated, use half of value shown.  
Hex wrench size for "Broached" version is located in the wrench size chart on page B-156.

# MCGILL® Inch Cam Follower Bearings

- Basic Construction Type:** Stud Type Crowned / Cylindrical Outside Diameter
- Rolling Elements:** Full Complement Needle Roller
- Bearing Material:** Bearing Quality Steel
- Seal Type:** LUBRI-DISC®
- Lubrication:** Lithium Soap Grease NLGI #2
- System Configuration:** Concentric / Eccentric / Heavy Stud
- Mounting Feature:** Slot / Hex Hole

For positive clamping, use housing thickness equal to G dimension  $\pm .010$ ".  
Clamping torque is based on dry threads. If threads are lubricated, use half of value shown.  
Hex wrench size for "Broached" version is located in the wrench size chart on page B-156.

# McGILL® Inch Cam Follower Bearings

- Basic Construction Type:** Stud Type Crowned / Cylindrical Outside Diameter
- Rolling Elements:** Full Complement Needle Roller
- Bearing Material:** Bearing Quality Steel
- Seal Type:** LUBRI-DISC®
- Lubrication:** Lithium Soap Grease NLGI #2
- System Configuration:** Concentric / Eccentric / Heavy Stud
- Mounting Feature:** Slot / Hex Hole

For positive clamping, use housing thickness equal to G dimension  $\pm .010$ ".  
Clamping torque is based on dry threads. If threads are lubricated, use half of value shown.  
Hex wrench size for "Broached" version is located in the wrench size chart on page B-156.

# McGILL® Inch Cam Follower Bearings

- Basic Construction Type:** Stud Type Crowned / Cylindrical Outside Diameter
- Rolling Elements:** Full Complement Needle Roller
- Bearing Material:** Bearing Quality Steel
- Seal Type:** LUBRI-DISC®
- Lubrication:** Lithium Soap Grease NLGI #2
- System Configuration:** Concentric / Eccentric / Heavy Stud
- Mounting Feature:** Slot / Hex Hole

\* Lubrication hole (F) at bottom of hex hole and 1/4 inch straight drive fitting will ball check supplied but not installed.  
For positive clamping, use housing thickness equal to G dimension  $\pm .010$ ".  
Clamping torque is based on dry threads. If threads are lubricated, use half of value shown.  
Hex wrench size for "Broached" version is located in the wrench size chart on page B-156.

# MCGILL® Inch Cam Follower Bearings

- Basic Construction Type:** Stud Type Crowned / Cylindrical Outside Diameter
- Rolling Elements:** Full Complement Needle Roller
- Bearing Material:** Bearing Quality Steel
- Seal Type:** LUBRI-DISC®
- Lubrication:** Lithium Soap Grease NLGI #2
- System Configuration:** Concentric / Eccentric / Heavy Stud
- Mounting Feature:** Slot / Hex Hole

# MCGILL® Inch Cam Follower Bearings

- Basic Construction Type:** Stud Type Crowned / Cylindrical Outside Diameter
- Rolling Elements:** Non-Metallic Bushing
- Bearing Material:** Bearing Quality Steel
- Seal Type:** LUBRI-DISC®
- Lubrication:** None - Self Lubricating Bushing
- System Configuration:** Concentric / Eccentric
- Mounting Feature:** Slot / Hex Hole

# MCGILL® Inch Cam Follower Bearings

- Basic Construction Type:** Stud Type Crowned / Cylindrical Outside Diameter
- Rolling Elements:** Non-Metallic Bushing
- Bearing Material:** Bearing Quality Steel
- Seal Type:** LUBRI-DISC®
- Lubrication:** None - Self Lubricating Bushing
- System Configuration:** Concentric / Eccentric
- Mounting Feature:** Slot / Hex Hole

## McGill Metric Cam Followers

McGill Metric CAMROL bearings are available with either a full complement, or caged (retainer type) set of needles featuring black oxide treated bearing steel while conforming to ISO standard envelope dimensions for use mechanical automation or linear motion applications. Our basic features each contribute to improved performance, while the LUBRI-DISC® seal option helps prevent metal to metal contact within the bearing while providing a barrier for contaminant entry and allow venting of excess or old grease during lubrication. In addition to the seal option these bearings are available with several dimensional choices and combinations to provide a solution specific for the application. Within the following section you can learn more about these features and how they can be applied to your application.

## Cam Follower Metric Nomenclature

### Basic Type, Construction

- MCF - Metric Cam Follower
- MCYR - Metric Cam Yoke Roller

### Construction Suffix

- R - Retained (Caged) Rolling Elements
- E - Eccentric Bushing

### Size

- Metric Stud Type: O.D. In mm
- Metric Yoke Type: Bore In mm
- A - Asian Dimensional Standard

### Optional Suffix

- S - LUBRI-DISC<sup>®</sup> Seal
- B - Broach (Hex Hole)
- X - Cylindrical O.D.

## Features and Benefits

### Single Row Full Complement Needle Rollers

The needle roller diameter, length, and number have been optimized to provide a high dynamic and static load rating, contained within industry standard bearing envelope dimensions.

### Heavy Section Outer

The heavy section outer helps support radial loading and provide proper rolling element support.

### Cylindrical Outside Diameter (OD)

The cylindrical OD can improve performance in certain applications such as improved track capacity by maximizing the contact area with the track.

### Zone Hardened Raceways

Heat treatment used to precisely harden working surfaces of the raceway and flange. The hardened surfaces provide support for the rolling element contact stresses, while keeping the core of the inner ductile to help absorb shock loads.

## Features and Benefits continued

### Integral Flange - Stud Type

The integral flange helps maintain bearing integrity throughout the bearing life. Zone hardened to provide wear resistance from incidental contact with the outer or rollers, and provides a sealing surface with LUBRI-DISC<sup>®</sup> seal option.

### Hardened Endplate

The endplate provides a locating shoulder when mounting the stud or yoke style cam follower. Also, similar to the flange, the endplate must resist wear from incidental contact with the outer or rollers. The hardened and ground endplate provides a sealing surface with LUBRI-DISC<sup>®</sup> seal option.

### Roll Formed Threads - Stud Type

Roll forming is the process used to produce threads. By moving the material into shape instead of cutting the threads, the threads are produced to meet class 6G tolerances and are work hardened resulting in improved holding power. Available in both Asian (with "A" suffix) or European Metric as standard.

### Factory Grease Fill

The cam follower and cam yoke roller bearings are factory lubricated with a medium temperature grease. Contact Application Engineering when application conditions require special lubricants.

### Lubrication Holes

Most sizes of McGill CAMROL bearings include lubrication hole(s) to accept a standard drive fitting or an included plug. The oil hole plug is recommended for closing unused lubrication hole to help protect against bearing contamination or lubrication loss.

McGill CAMROL Yoke roller bearings include a lubrication hole to provide a passage for lubrication to the rolling elements from the yoke roller bore. The customer supplied shaft must provide an axial lubrication path to supply bearing.

## Features and Benefits continued

### Black Oxide Finish

Bearings have a black oxide finish on all external surfaces.

### Permanent Marking

Part number permanently marked on bearing face, helps bearing identification after years of service.

### Installation Accessory Pack

All McGill Metric Cam followers include (2) jam nuts to ensure proper thread type (Asian / European), Fitting and plug to help provide proper lubrication path to the rolling elements and prevent contamination from entering the bearing through a unused hole.

## Options

### Retainer Type

The retainer (cage) option provides heat-treated steel cage for improved durability and wear resistance. The needle separation produces larger lubrication reservoir and helps achieve higher bearing speeds.. The cages are designed with two rollers per pockets (except 13, 16 and 19mm OD's) to help improve static and dynamic load ratings.

## Options

### LUBRI-DISC<sup>®</sup> Seal

The CAMROL standard for seals, the LUBRI-DISC seal not only helps keep contaminants out and lubrication in the bearing, but with an integral back plate to separate the metal to metal contact between the outer ring and endplate(s) or flange. The back plate feature reduce friction resulting in lower operating temperatures which can extend grease life and allowing for higher operating speeds. Our seal also includes vents to help prevent seal blowout during relubrication. The LUBRI-DISC seal option has a good balance of sealing and low drag operation essential to a precision cam follower suited for most industrial applications.

### Crowned Outside Diameter (OD)

A crown on the OD of a cam follower bearing can help increase bearing life versus a standard cylindrical cam follower. The crown achieves this performance by helping to distribute the stress on the outer ring and rolling elements resulting from misalignment due to mounting inaccuracy or stud deflection. The crown may also help reduce outer skidding in turntable or rotary applications. Not all applications may see the benefit of a crowned OD, consult Application Engineering for guidance for your application.

### Hex Hole (Broached)

The hex hole can aide in the installation and removal of stud type cam followers by a more positive hold on the cam follower stud versus a standard screw driver slot. The hex feature is identified with a "B" since it is produced using a broach process. Bearing relubrication from flange end must be considered for sizes under 3".

### Eccentric Stud

Eccentric stud option provides a means of adjusting the radial position of the bearing, which can improve the load sharing of inline bearing combinations. Cam follower load sharing helps reduce operation costs by reducing premature failures due to overloaded bearings, the need of precise mounting hole location tolerances and providing ability to realign bearing due to track wear. Eccentric bushing is press fit on stud and unhardened to permit dowel or setscrew for permanent locking.

## Additional Options

### BHT

Broached (Hex) hole at threaded end of cam follower stud.

### THT

Threaded axial lubrication hole at threaded end of cam follower stud.

### THF

Threaded axial lubrication hole at flanged end of cam follower stud. Available with all screw driver slot cam followers or broached cam followers over 3".

### THB

Threaded axial oil hole on both ends of cam follower stud. Available with all screw driver slot cam followers or broached cam followers over 3".

### ALG

Annular lubrication groove at cam follower stem radial lubrication hole.

## **Custom Capabilities**

- *Customer specified factory grease fill*
- *Grease fitting installed*
- *Stud or thread length modifications*
- *Roller diameter variations or tolerances*
- *Cam followers grouped or matched diameter tolerance / run out sets*
- *Custom engineered to order designs*

# MCGILL® Metric CAMROL Bearings

- Basic Construction Type:** Stud Type Crowned / Cylindrical Outside Diameter
- Rolling Elements:** Full Complement / Retained (Caged) Needle Roller
- Bearing Material:** Bearing Quality Steel
- Seal Type:** LUBRI-DISC®
- Lubrication:** Lithium Soap Grease NLGI #2
- System Configuration:** Concentric / Eccentric
- Mounting Feature:** Slot / Hex Hole

1. Standard bearing has a crowned roller outside diameter. For straight cylindrical outside roller diameter, add suffix "X". Example - MCFR-35-X or MCF-35-SX.  
 2. Clamping torque is based on dry threads. If threads are lubricated, use half of value shown.  
 3. Static load rating is based on stud strength or on internal rolling element load distribution stresses.

Inch dimensions for reference only.

4. Dynamic load should not exceed 50% of Dynamic Rating as a track roller.

5. Since load, lubrication method, temperature and other factors affect the maximum operating speed, it is impossible to determine precise limiting speed. The listed limiting speeds are based on lightly loaded bearings having adequate lubrication and are listed only as a design guide. More frequent relubrication is required when operating at higher speeds. Actual bearing testing in the specific application should be conducted if the anticipated operating speed approaches the listed limiting speed.

\* Sizes 13 - 19 have no lube holes in the threaded end of the stud.

1. Standard bearing has a crowned roller outside diameter. For straight cylindrical outside roller diameter, add suffix "X". Example - MCFR-35-X or MCF-35-SX.  
 2. Clamping torque is based on dry threads. If threads are lubricated, use half of value shown.  
 3. Static load rating is based on stud strength or on internal rolling element load distribution stresses.  
 4. Dynamic load should not exceed 50% of Dynamic Rating as a track roller.  
 5. Since load, lubrication method, temperature and other factors affect the maximum operating speed, it is impossible to determine precise limiting speed. The listed limiting speeds are based on lightly loaded bearings having adequate lubrication and are listed only as a design guide. More frequent relubrication is required when operating at higher speeds. Actual bearing testing in the specific application should be conducted if the anticipated operating speed approaches the listed limiting speed.

Inch dimensions for reference only.  
 Not all parts are available from stock. Please contact customer service for availability (800) 626-2120.  
 For more information on bearing capabilities outside of our standard offering, please contact Application Engineering (800) 626-2093.

1. Standard bearing has a crowned roller outside diameter. For straight cylindrical outside roller diameter, add suffix "X". Example - MCFR-35-X or MCF-35-SX.  
 2. Clamping torque is based on dry threads. If threads are lubricated, use half of value shown.  
 3. Static load rating is based on stud strength or on internal rolling element load distribution stresses.  
 4. Dynamic load should not exceed 50% of Dynamic Rating as a track roller.  
 5. Since load, lubrication method, temperature and other factors affect the maximum operating speed, it is impossible to determine precise limiting speed. The listed limiting speeds are based on lightly loaded bearings having adequate lubrication and are listed only as a design guide. More frequent relubrication is required when operating at higher speeds. Actual bearing testing in the specific application should be conducted if the anticipated operating speed approaches the listed limiting speed.

Inch dimensions for reference only.  
 Not all parts are available from stock. Please contact customer service for availability (800) 626-2120.  
 For more information on bearing capabilities outside of our standard offering, please contact Application Engineering (800) 626-2093.

# MCGILL® Metric CAMROL Bearings

- Basic Construction Type:** Stud Type Crowned / Cylindrical Outside Diameter
- Rolling Elements:** Full Complement / Retained (Caged) Needle Roller
- Bearing Material:** Bearing Quality Steel
- Seal Type:** LUBRI-DISC®
- Lubrication:** Lithium Soap Grease NLGI #2
- System Configuration:** Concentric / Eccentric
- Mounting Feature:** Slot / Hex Hole

1. Standard bearing has a crowned roller outside diameter. For straight cylindrical outside roller diameter, add suffix "X". Example - MCFR-35-X or MCF-35-SX.  
 2. Clamping torque is based on dry threads. If threads are lubricated, use half of value shown.  
 3. Static load rating is based on stud strength or on internal rolling element load distribution stresses.  
 4. Dynamic load should not exceed 50% of Dynamic Rating as a track roller.  
 5. Since load, lubrication method, temperature and other factors affect the maximum operating speed, it is impossible to determine precise limiting speed. The listed limiting speeds are based on lightly loaded bearings having adequate lubrication and are listed only as a design guide. More frequent relubrication is required when operating at higher speeds. Actual bearing testing in the specific application should be conducted if the anticipated operating speed approaches the listed limiting speed.

Inch dimensions for reference only.  
 Not all parts are available from stock. Please contact customer service for availability (800) 626-2120.  
 For more information on bearing capabilities outside of our standard offering, please contact Application Engineering (800) 626-2093.

1. Standard bearing has a crowned roller outside diameter. For straight cylindrical outside roller diameter, add suffix "X". Example - MCFR-35-X or MCF-35-SX.  
 2. Clamping torque is based on dry threads. If threads are lubricated, use half of value shown.  
 3. Static load rating is based on stud strength or on internal rolling element load distribution stresses.  
 4. Dynamic load should not exceed 50% of Dynamic Rating as a track roller.  
 5. Since load, lubrication method, temperature and other factors affect the maximum operating speed, it is impossible to determine precise limiting speed. The listed limiting speeds are based on lightly loaded bearings having adequate lubrication and are listed only as a design guide. More frequent relubrication is required when operating at higher speeds. Actual bearing testing in the specific application should be conducted if the anticipated operating speed approaches the listed limiting speed.

Inch dimensions for reference only.  
 Not all parts are available from stock. Please contact customer service for availability (800) 626-2120.  
 For more information on bearing capabilities outside of our standard offering, please contact Application Engineering (800) 626-2093.

1. Standard bearing has a crowned roller outside diameter. For straight cylindrical outside roller diameter, add suffix "X". Example - MCFR-35-X or MCF-35-SX.  
 2. Clamping torque is based on dry threads. If threads are lubricated, use half of value shown.  
 3. Static load rating is based on stud strength or on internal rolling element load distribution stresses.  
 4. Dynamic load should not exceed 50% of Dynamic Rating as a track roller.  
 5. Since load, lubrication method, temperature and other factors affect the maximum operating speed, it is impossible to determine precise limiting speed. The listed limiting speeds are based on lightly loaded bearings having adequate lubrication and are listed only as a design guide. More frequent relubrication is required when operating at higher speeds. Actual bearing testing in the specific application should be conducted if the anticipated operating speed approaches the listed limiting speed.

Inch dimensions for reference only.  
 Not all parts are available from stock. Please contact customer service for availability (800) 626-2120.  
 For more information on bearing capabilities outside of our standard offering, please contact Application Engineering (800) 626-2093.

For a tight fit and heavy loads, us ISO tolerance J6.

## Heavy-Duty Inch and Metric CAMROL®

McGill Heavy-Duty CAMROL bearings are full complement cylindrical roller bearings featuring black oxide treated bearing steel, available in two basic mounting styles (stud or yoke) for use mechanical automation or linear motion applications. Our standard integral flange construction of stud version bearings helps maintain bearing integrity throughout the life. The inch series utilizes a rubber lip seal to provide a barrier for contamination and lubricant retention. Within the following section you can learn more about how these features and others can be applied to your application.

# Cam Follower Inch and Metric Nomenclature

## Features and Benefits

### Double Row Full Complement Needle Rollers

The roller diameter to length ratio of Cylindrical rollers provides an end face and increases surface area to help support incidental thrust loads.

### Heavy Section Outer

The heavy section outer helps support radial loading and provide proper rolling element support.

### Rubber Lip Seals - Inch Series

Heavy-Duty CAMROL® Bearings have rubber lip seals to help keep contamination out and lubricant in. The seals are mounted inward to improve grease retention. Inch Only, removed as option- NS

### Metallic Shields - Metric Series

The metric series Heavy-Duty bearings metallic side shields providing a barriers to help retain grease and keep out contaminants. Metric Only, removed as option – NS

### Crowned Outside Diameter (OD)

A crown on the OD of a cam follower bearing can increase bearing life versus a standard cylindrical cam follower. The crown achieves this performance by helping to distribute the stress on the outer ring and rolling elements resulting from misalignment due to mounting inaccuracy or stud deflection. The crown also helps reduce outer skidding in turntable or rotary applications. Not all applications may see the benefit of a crowned OD, consult Application Engineering for guidance for your application. Crowned OD is an option for Inch Series. Crowned OD is standard for Metric Series.

## Features and Benefits continued

### Cylindrical Outside Diameter (OD)

The cylindrical OD can improve performance in certain applications such as improved track capacity by maximizing the contact area with the track. Cylindrical OD is standard for Inch Series. Cylindrical OD is an option for Metric Series.

### Zone Hardened Raceways

Heat treatment used to precisely harden working surfaces of the raceway and flange. The hardened surfaces provide support for the rolling element contact stresses, while keeping the core of the inner ductile to help absorb shock loads.

### Integral Flange

The integral flange helps maintain bearing integrity throughout the bearing life. Zone hardened to provide wear resistance from incidental contact with the outer or rollers, and provides a sealing surface for rubber lipped seal.

### Hex Hole (Broached)

The hex hole can aid in the installation and removal of stud type cam followers by increasing the holding power over a standard screw driver slot.  
\*Standard on inch, option on Metric.

## Features and Benefits continued

### Hardened Endplate

Similar to the flange, the endplate must provide a contact surface for the seal and resist wear from incidental contact with the outer or rollers.

### Factory Grease Fill

The cam follower and cam yoke roller bearings are factory lubricated with a medium temperature grease. Contact Application Engineering when application conditions require special lubricants.

### Lubrication Reservoir

The inch series heavy-Duty bearings incorporate a spacer, resulting in an increased lubricant reservoir. Inch only

### Black Oxide Finish

Bearings have a black oxide finish on all external surfaces.

## Options

### Permanent Marking

Part number permanently marked on bearing face, helps bearing identification after years of service.

### Installation Accessory Pack - Metric Series Stud Type

All McGill Metric Cam followers include (2) oil hole plug to help provide proper lubrication path to the rolling elements and prevent contamination from entering the bearing through a unused oil hole. Metric only, Inch as -OH option,

### Eccentric Stud

Eccentric stud option provides a means of adjusting the radial position of the bearing, which can improve the load sharing of inline bearing combinations. Cam follower load sharing helps reduce operation costs by reducing premature failures due to overloaded bearings, the need of precise mounting hole location tolerances and providing ability to realign bearing due to track wear.

## Additional Options

**BHT**  
Broached (Hex) hole at threaded end of cam follower stud.

**THT**  
Threaded axial lubrication hole at threaded end of cam follower stud.

**THF**  
Threaded axial lubrication hole at flanged end of cam follower stud. Available with all screw driver slot cam followers or broached cam followers over 3”.

**THB**  
Threaded axial oil hole on both ends of cam follower stud. Available with all screw driver slot cam followers or broached cam followers over 3”.

**ALG**  
Annular lubrication groove at cam follower stem radial lubrication hole.

## **Custom Capabilities**

- *Customer specified factory grease fill*
- *Grease fitting installed*
- *Stud or thread length modifications*
- *Roller diameter variations or tolerances*
- *Cam followers grouped or matched diameter tolerance / run out sets*
- *Custom engineered to order designs*

# MCGILL® Heavy Duty CAMROL Bearings

- Basic Construction Type:** Stud Type Crowned / Cylindrical Outside Diameter
- Rolling Elements:** Full Complement Cylindrical Roller
- Bearing Material:** Bearing Quality Steel
- Seal Type:** LUBRI-DISC
- Lubrication:** Lithium Soap Grease NLGI #2
- System Configuration:** Concentric / Eccentric / Heavy Stud
- Mounting Feature:** Slot / Hex Hole

1. Standard bearing has a crowned roller outside diameter. For straight cylindrical outside roller diameter, add suffix "X". Example - MCFD-35-X.  
 2. Since load, lubrication method, temperature and other factors affect the maximum operating speed, it is impossible to determine precise limiting speed. The listed limiting speeds are based on lightly loaded bearings having adequate lubrication and are listed only as a design guide. If grease lubricated, frequent relubrication is required. Actual bearing testing in the specific application should be conducted if the anticipated operating speed approaches the listed limiting speed.  
 3. Clamping torque is based on dry threads. If threads are lubricated, use half of value shown.

Inch dimensions for reference only.

# MCGILL® Heavy Duty CAMROL Bearings

- Basic Construction Type:** Stud Type Crowned / Cylindrical Outside Diameter
- Rolling Elements:** Full Complement Cylindrical Roller
- Bearing Material:** Bearing Quality Steel
- Seal Type:** Metallic Shield
- Lubrication:** Lithium Soap Grease NLGI #2
- System Configuration:** Concentric / Eccentric / Heavy Stud
- Mounting Feature:** Slot / Hex Hole
- Dimensional Interchange:** ISO Standard

Heavy Duty Metric Cam Follower

1. Standard bearing has a crowned roller outside diameter. For straight cylindrical outside roller diameter, add suffix "X". Example - MCFD-35-X.  
 2. Since load, lubrication method, temperature and other factors affect the maximum operating speed, it is impossible to determine precise limiting speed. The listed limiting speeds are based on lightly loaded bearings having adequate lubrication and are listed only as a design guide. If grease lubricated, frequent relubrication is required. Actual bearing testing in the specific application should be conducted if the anticipated operating speed approaches the listed limiting speed.  
 3. Clamping torque is based on dry threads. If threads are lubricated, use half of value shown.

Metric dimensions for reference only.  
 Not all parts are available from stock. Please contact customer service for availability (800) 626-2120.  
 For more information on bearing capabilities outside of our standard offering, please contact Application Engineering (800) 626-2093.

## McGill Special Duty Cam Followers

Special-Duty CAMROL bearings are available feature black oxide treated bearing steel in both inch and metric sizes for your motion control needs. Designed for severe applications, bearings thick section outer race, together with a caged (retainer) needle roller set provides the basic foundation for a cam follower suited for severe duty. Integral flange construction, on stud version bearings help maintain bearing integrity throughout the service life. A metallic face plug seal provides a wear resistant seal while the heavy duty seal provides a barrier for contaminate entry to support reduced maintenance applications. Within the following section you can learn more about these feature and how the can be applied to your tough application.

Inch Series is Dimensionally Interchangeable with Standard INCH CAMROL Factory Filled Synthetic Grease.

# Special Duty Cam Follower Nomenclature

## Features and Benefits

### Retainer Type

The retainer (cage) option provides heat-treated steel cage for improved durability and wear resistance. The needle separation produces larger lubrication reservoir and helps achieve higher bearing speeds. The cages are designed with two rollers per pockets to help improve static and dynamic load ratings.

### Heavy Section Outer

The heavy section outer helps support radial loading and provide proper rolling element support.

### LUBRI-DISC® Seal

The CAMROL standard for seals, the LUBRI-DISC seal helps keep contaminants out and lubrication in the bearing, with an integral back plate to separate the metal to metal contact between the outer ring and endplate(s) or flange. The back plate feature reduces friction resulting in lower operating temperatures which can extend grease life and allowing for higher operating speeds. The seal also includes vents to help prevent seal blowout during relubrication, while the outer raceway is machined with a reservoir for additional lubricant capacity. The LUBRI-DISC seal option has a good balance of sealing, lubricant capacity, and low drag operation essential to a precision cam follower suited for most industrial applications.

### End Plug Seal

Metallic Plug seal helps keep contamination out of the bearing and resistant to weld spatter, abrasive contaminants and washout. The plug installed into the outer encapsulates the flange side of the bearing resulting in a large grease reservoir and wear resistant bearing seal.

### Cylindrical Outside Diameter (OD)

The cylindrical OD can improve performance in certain applications such as improved track capacity by maximizing the contact area with the track.

## Features and Benefits continued

### Zone Hardened Raceways

Heat treatment used to precisely harden working surfaces of the raceway and flange. The hardened surfaces provide support for the rolling element contact stresses, while keeping the core of the inner ductile to help absorb shock loads.

### Hex Hole (Broached)

The hex hole can aid in the installation and removal of stud type cam followers by increasing the holding power over a standard screw driver or milled slot.

### Hardened Endplate

Similar to the flange, the endplate must provide a seal surface for the LUBRI-DISC seal and resist wear from incidental contact with the outer or rollers. The hardened and ground endplate provides a sealing surface with LUBRI-DISC<sup>®</sup> seal option.

## Features and Benefits

### LUBRI-DISC® Thrust Washer

Utilizing the LUBRI-DISC properties as a back plate to separate the metal to metal contact between the outer ring and endplate(s) or flange. The back plate feature reduces friction resulting in lower operating temperatures which can extend grease life and allowing for higher operating speeds.

### Factory Grease Fill

The cam follower and cam yoke roller bearings are factory lubricated with synthetic grease. Contact Application Engineering when application conditions require special lubricants

### Black Oxide Finish

Bearings have a black oxide finish on all external surfaces.

### Permanent Marking

Part number permanently marked on bearing face, helps bearing identification after years of service.

### Installation Accessory Pack

All McGill stud type special duty Cam followers include (2) jam nuts to ensure proper thread type (Metric/ Inch), grease fitting and oil hole plug to help provide proper lubrication path to the rolling elements and prevent contamination from entering the bearing through a unused oil hole.

## Options

### Eccentric Stud

Eccentric stud option provides a means of adjusting the radial position of the bearing which can improve the load sharing of inline bearing combinations. Cam follower load sharing helps reduce operation costs by reducing premature failures due to overloaded bearings, the need of precise mounting hole location tolerances and providing ability to realign bearing due to track wear.

## **Custom Capabilities**

- *Customer specified factory grease fill*
- *Stud or thread length modifications*
- *Roller diameter variations or tolerances*
- *Cam followers grouped or matched diameter tolerance / run out sets*
- *Custom engineered to order designs*

# MCGILL® Special Duty CAMROL Bearings

- Basic Construction Type:** Stud Type Crowned / Cylindrical Outside Diameter
- Rolling Elements:** Retained (Caged) Needle Roller
- Bearing Material:** Bearing Quality Steel
- Seal Type:** Metal Extension Plug and Rubber Lip Seal
- Lubrication:** Synthetic Grease NLGI #2
- System Configuration:** Concentric / Eccentric
- Mounting Feature:** Hex Hole on Thread Face

## McGill TRAKROL Followers

TRAKROL bearings feature black oxide treated bearing steel and utilize either a precision ball or tapered roller bearing insert for longer operating life under combination radial and thrust loads. The capacity for combination loads allow the TRAKROL bearing to be available in plain (cylindrical), V-groove, and flanged O.D. in both stud and yoke styles. Small sizes (<3" OD or point diameter) use sealed ball bearing inserts along with a NYLAPLATE seal for additional protection. Stud type configurations utilize a metal end plug seal on the roller face providing a long lasting seal. Both bearing types provide a large internal grease reservoir along with special sealing makes TRAKROL bearings an excellent choice where reduced maintenance is required.

## TRAKROL Nomenclature

## Features and Benefits

### Configurations

TRAKROL® bearings feature precision ball bearings or tapered roller bearings to help provide longer life when subjected to a combination of radial and thrust loads.

#### Plain Series

Plain OD bearings are generally used to support radial loads. Can also act as a “float” bearing when used in conjunction with a flange or V-Groove type.

#### Flanged Series

Flanged OD bearings are popular in guide rail applications since integral flange help direct the load axially.

#### V-Groove Series

Typically used with “V” shaped tracks for both guidance and radial support. The configuration of the track reduces the amount of sediment build-up on the track.

#### Heavy Section Outer

The heavy section outer helps support radial loading and provide proper rolling element support.

#### Sealing

All TRAKROL bearing utilize rubber lip seals to help improve sealing and grease retention. TRAKROL bearings under 3” feature a ball bearing insert along with a NYLAPLATE wiping seal for addition protection. The NYLAPLATE seal is exclusive to McGill TRAKROL bearings and complements the rubber lip seal provided with the bearing insert.

## Features and Benefits continued

### Steel Plug

Metallic Plug seal helps keep contamination out the bearing and is resistant to weld spatter, abrasive contaminants and washout.

### Cylindrical Outside Diameter (OD)

The cylindrical OD can improve performance in certain applications such as improved track capacity by maximizing the contact area with the track.

### Ductile Material

Ductile stem helps resist shock loads.

### Factory Grease Fill

The bearings are factory lubricated with medium temperature grease. Contact Application Engineering when application conditions require special lubricants.

### Black Oxide Finish

Bearings have a black oxide finish on all external surfaces.

### Permanent Marking

Part number permanently marked on bearing face, helps bearing identification after years of service.

# MCGILL® TRAKROL Cam Follower Bearings

- Basic Construction Type:** Stud Type Flanged Outside Diameter
- Rolling Elements:** Ball or Tapered Roller Bearing Insert
- Bearing Material:** Bearing Quality Steel
- Seal Type:** Metal Extension Plug and Rubber Lip Seal Ball Bearing with Additional NYLAPLATE Seal
- Lubrication:** Polyurea Thickened Grease NLGI #2
- Stem Configuration:** Concentric / Eccentric / Heavy Stud
- Mounting Feature:** Hex Hole on Thread Face

## Load Ratings and Life

### Life Calculations

The L10 (rating) life for any given application and bearing selection can be calculated in terms of millions of revolutions by using the bearing Basic Dynamic Rating and applied radial load (or, equivalent radial load in the case of radial bearing applications having combined radial and thrust loads). The L10 life for any given application can be calculated in terms of hours, using the bearing Basic Dynamic Rating, applied load (or equivalent radial load) and suitable speed factors, by the following equation:

$$L_{10} = \left(\frac{C}{P}\right) \times \frac{1,000,000}{60 \times n} = \left(\frac{C}{P}\right)^{10/3} \times \frac{16667}{n}$$

Where:

$L_{10}$  = The # of hours that 90% of identical bearings under ideal conditions will operate at a specific speed and condition before fatigue is expected to occur.

C = Basic Dynamic Rating (lbs)  
1,000,000 Revolutions

P = Constant Equivalent Radial Load (lbs)

n = Speed (RPM)

Additionally, the ABMA provides application factors for all types of bearings which need to be considered to determine an adjusted Rated Life ( $L_{na}$ ). L10 life rating is based on laboratory conditions yet other factors are encountered in actual bearing application that will reduce bearing life.  $L_{na}$  life rating takes into account reliability factors, material type, and operating conditions.

$$L_{na} = a_1 \times a_2 \times a_3 \times L_{10}$$

Where:

$L_{na}$  = Adjusted Rated Life.

$a_1$  = Reliability Factor. Adjustment factor applied where estimated fatigue life is based on reliability other than 90% (See Table No 1).

Table No. 1 Life Adjustment Factor for Reliability

Reliability %	$L_{na}$	$a_1$
90	L10	1
95	L5	0.62
96	L4	0.53
97	L3	0.44
98	L2	0.33
99	L1	0.21
50	L50	5

$a_2$  = Material Factor. Life adjustment for bearing race material. Power Transmission Solutions bearing races are manufactured from bearing quality steel. Therefore the  $a_2$  factor is 1.0.

$a_3$  = Life Adjustment Factor for Operating Conditions. This factor should take into account the adequacy of lubricant, presence of foreign matter, conditions causing changes in material properties, and unusual loading or mounting conditions. Assuming a properly selected and mounted bearing having adequate seals and lubricant, the  $a_3$  factor should be 1.0.

# Load Ratings and Life Continued

Vibration and shock loading can act as an additional loading to the steady expected applied load. When shock or vibration is present, an a3 Life Adjustment Factor can be applied. Shock loading has many variables which often are not easily determined. Typically, it is best to rely on one's experience with the particular application. Consult Application Engineering for assistance with applications involving shock or vibration loading.

The a3 factor takes into account a wide range of application and mounting conditions as well as bearing features and design. Accurate determination of this factor is normally achieved through testing and in-field experience. Power Transmission Solutions offers a wide range of options which can maximize bearing performance. Consult Application Engineering for more information.

## Variable Load Formula

Root mean load (RML) is to be used when a number of varying loads are applied to a bearing for varying time limits. Maximum loading still must be considered for bearing size selection.

$$RML^* = \sqrt[10/3]{\frac{(L_1^{10/3} N_1) + (L_2^{10/3} N_2) + (L_3^{10/3} N_3)}{100}}$$

Where:

RML = Root Mean Load (lbs.)

L<sub>1</sub>, L<sub>2</sub>, etc. = Load in pounds

N<sub>1</sub>, N<sub>2</sub>, etc. = Percent of total time operated at loads L<sub>1</sub>, L<sub>2</sub>, etc.

\* Apply RML to rating at mean speed to determine resultant life.

## Mean Speed Formula

The following formula is to be used when operating speed varies over time.

$$\text{Mean Speed} = \frac{S_1 N_1 + S_2 N_2 + S_3 N_3}{100}$$

S<sub>1</sub>, S<sub>2</sub>, etc = Speeds in RPM

N<sub>1</sub>, N<sub>2</sub>, etc = Percentage of total time operated at speeds S<sub>1</sub>, S<sub>2</sub>, etc

## Load Ratings and Life Continued

### Bearing Life In Oscillating Applications

The equivalent rotative speed (ERS) is used in life calculations when the bearing does not make complete revolutions during operation. The ERS is then used as the bearing operating speed in the calculation of the L10 (Rating) Life. The formula is based on sufficient angular rotation to have roller paths overlap.

$$\begin{aligned} \text{ERS} &= \text{Equivalent Rotative Speed} \\ \text{N} &= \text{Total number of degrees per minute through} \\ &\quad \text{which the bearing will rotate.} \\ \text{ERS} &= \frac{\text{N}}{360} \end{aligned}$$

In the above formula, allowance is made for the total number of stress applications on the weakest race per unit time, which, in turn, determines fatigue life and the speed factors. The theory behind fretting corrosion is best explained by the fact that the rolling elements in small angles of oscillation retrace a path over an unchanging area of the inner or outer races where the lubricant is prevented by inertia from flowing in behind the roller as the bearing oscillates in one direction. Upon reversal, this small area of rolling contact is traversed by the same roller in the dry state. The friction of the two unlubricated surfaces causes fretting corrosion and produces failures which are unpredictable from a normal life standpoint.

With a given bearing selected for an oscillating application, the best lubrication means is a light mineral oil under positive flow conditions. With a light oil, there is a tendency for all areas in the bearing load zone to be immersed in lubricant at all times. The full flow lubrication dictates that any oxidized material which may form is immediately carried away by the lubricant, and since these oxides are abrasive, further wear tends to be avoided. If grease lubrication must be used, it is best to consult with either the bearing manufacturer or the lubricant manufacturer to determine the best possible type of lubricant. Greases have been compounded to resist the detrimental effect of fretting corrosion for such applications.

### Static Load Rating

The “static load rating” for rolling element bearings is that uniformly distributed static radial load acting on a non-rotating bearing, which produces a contact stress of 580,000 psi (roller bearings) or 607,000 psi (ball bearings) at the center of the most heavily loaded rolling element. At this stress level, plastic deformation begins to be significant. Experience has shown that the plastic deformation at this stress level can be tolerated in most bearing applications without impairment of subsequent bearing operation. In certain applications where subsequent rotation of the bearing is slow and where smoothness and friction requirements are not too exacting, a higher static load limit can be tolerated. Where extreme smoothness is required or friction requirements are critical, a lower static load limit may be necessary.

### Minimum Bearing Load

Skidding, or sliding, of the rolling elements on the raceway instead of a true rolling motion can cause excessive wear. Applications with high speeds and light loading are particularly prone to skidding. As a general guideline, rolling element bearings should be radially loaded at least 2% of Basic Dynamic Rating. For applications where load is light relative to the bearings dynamic load rating, consult Application Engineering for assistance.

# Load Ratings and Life Continued

## Bushing Type Cam Follower/ Yoke Roller

Because bushing type bearings operate with sliding motion instead of rolling motion, they do not follow standard bearing life theory. Instead, life is based on an acceptable wear rate based on operating load and speed for the given bearing size. The following chart and examples are provided to aid in selection of bushing type cam followers

To determine maximum bearing capacity at a given speed, read vertical load scale under basic bearing size under consideration at proper speed.

### Example:

Determine load capacity of BCF-3/4-S at 100 RPM. Read down vertical load scale under basic 3/4 size to intersection of horizontal line for maximum speed of 100 RPM. Load rating would be 100 pounds.

To determine minimum bearing size required for application, draw horizontal line through application speed until application load can be read on one of the vertical load scales. The basic bearing size can then be read at the top of the column.

### Example:

- Application speed = 200 RPM
- Application load = 50 pounds

Minimum basic bearing size required would be a BCF or BCYR - 1 1/4-S.

Values based on continuous rotation and no lubrication

## Cam Follower Engineering Section

### Load Ratings

ABMA and ISO Dynamic and Static Load Ratings, when listed, follow standard calculations as accepted by ABMA and ISO. These ratings are based on a bearing that is fully supported within a rigid housing. Cam follower and track roller bearings generally operate with an unsupported outer ring in rolling contact with a cam or track. As such, these standard ratings cannot be applied. ABMA and ISO dynamic and static load ratings when listed in the dimension tables for cam follower and track roller bearings are therefore provided for comparison only.

When listed, Track Roller Dynamic Load Rating is to be used for the purpose of bearing size selection or theoretical bearing life calculation. The track roller rating considers the unsupported outer ring condition of the cam follower or track roller bearing design. The Maximum Permissible Load as listed considers stud strength. Static loads should not exceed the Maximum Permissible Load.

Track Roller Static Load Rating as listed considers internal rolling element contact stress. Static loads greater than the Static Rating may impair subsequent dynamic operations.

### Load Considerations

In any bearing application, radial, shock and thrust loads must be taken into consideration to help assure successful performance.

### Radial Load

Maximum dynamic radial load should not exceed 50% of Basic Dynamic Rating. If radial load and/or root mean load exceed 50% of Basic Dynamic Rating, life calculations must be reviewed by Application Engineering. If dynamic radial loads exceed 25% of Basic Dynamic Rating, consideration should be given to use of heavy stud option (CFH series) or yoke type (CYR, CYR-CR, CYRD, MCYR, MCYRD series). Applications involving reversing radial loads should be reviewed by Application Engineering.

# Cam Follower Engineering Section continued

## Shock Load

The load ratings in this catalog are based on uniform and steady loading. When the loading is of a shock nature and/or vibration is present, or the loading is indeterminate, a bearing of greater rating must be selected. If such conditions exist, it is advisable to use the Load Factor as shown in the table below. The actual bearing load should be multiplied by the appropriate load factor and the resultant value used to calculate the bearing life or to determine the required Basic Dynamic Rating as described in the General Engineering Section.

Type of Load	Load Factor
Uniform and Constant	1.0
Light Shock	1.5
Moderate Shock	2.0
Heavy Shock	3.0

## Thrust Load Series CF, CFH, CYR, BCF, BCYR, CF-CR, CYR-CR, SDCF, SDMCF, MCF, MCYR

Designed for radial loads, these series' bearings do not have design features that help them to support thrust loading. Therefore, these cam followers and track rollers should be mounted to minimize, or preferably eliminate, the possibility of any thrust loading on the outer ring.

## Series CFD, CYRD, MCFD, MCYRD

These series provide improved thrust capability versus the above needle rolling element and bushing type designs. They are designed using a double row of full complement cylindrical rolling elements. Their construction helps to support incidental thrust sometimes associated with cam follower and track roller applications.

## Series PCF, FCF, VCF, PCYR, FCYR, VCYR

These series use radial ball and tapered roller bearing assemblies. These constructions make possible successful bearing operation with various combinations of radial and thrust loads. Refer to dimension tables for specific thrust load ratings.

## Track Design

Since either cam followers or cam yoke rollers are merely one component of a two-piece bearing construction involving (1) the cam follower or cam yoke roller and (2) the track or cam on which it operates, some consideration must be given to selection of track or cam materials, since they must be considered bearing components and have a direct effect upon ultimate life and performance of the cam roll application. From the standpoint of track design where bearings are used as support or guide rollers, it is often difficult to obtain high hardness and tensile strength values for the machine members against which the bearings operate. In most applications, in the interest of economy, relatively soft structural materials can be applied. Where dimensional accuracy is not extremely critical, the work hardening of ferrous, low carbon track materials, accompanied by relatively small amounts of wear-in of the bearing into the track surface generally results in satisfactory bearing performance. It is common, for instance, in the application of cam follower or cam yoke roller bearings as lift truck mast rollers to employ formed structural steel sections as bearing track support members. The wearing-in and work hardening of the track surface generally results in a satisfactory bearing application, providing loads are not excessive.

## Cam Follower Engineering Section continued

### Track Capacity

Track capacity of all cam followers and cam yoke roller bearings is the load which a steel track of a given tensile strength will withstand without plastic deformation or brinelling of the track surface. The following tables list track capacities and track capacity factors for steel tracks, as applied to all cam follower and cam yoke roller bearings except crowned O.D. versions. For the crowned O.D. versions, multiply by 0.8 to obtain the track capacity ratings.

To obtain track capacities for a track hardness other than 40 Rockwell “C” scale (180,000 psi or 1242 Mpa tensile strength), multiply the track capacity by the track capacity factor in Table 1. Regardless of the resulting track capacity, dynamic load should not exceed 50% of the dynamic rating as a track roller and static load should not exceed the static rating as a track roller for that bearing.

**Table 1 - Track Capacity Factor**

Track Tensile Strength, psi	Track Tensile Strength, MPa	Track Hardness Rockwell “C”	Track Capacity Factor

# Cam Follower Engineering Section continued

## Cam Design

Most cam applications are similar in many respects to the track or support roller applications; however, usually bearing speeds are higher due to the multiplication of cam revolutions per minute by the ratio of the cam O.D. to the cam follower O.D. For cam applications, oil lubrication is preferred due to the tendency towards higher speeds noted above. Where such lubrication methods are not possible, frequent replacement of grease should be followed.

In the application of box or drum cams, it is possible to obtain differential rotation of the cam follower outer race as well as associated load reversals. Unless proper cam hardness and materials are employed as well as ample lubrication, excessive cam or cam follower wear may result. In box cams of this nature, the cam rise and cam fall should be watched closely, since the load reversal encountered can cause shock loads in excess of the capacity of the stud or the bearing.

The above precaution would also apply to ordinary circular cams, and instantaneous loads due to rapid cam rise should be carefully calculated and kept below the maximum recommended load or static capacity as listed for the bearing.

In ordinary cam design it is possible to employ the most efficient materials for best resistance to fatigue and brinelling. Attainment of high track surface hardnesses associated with good wear resistance are quite feasible. The same general precautions with regard to tensile strength versus hardness, as listed under track design above, should be followed for cam design; and applications involving high marginal bearing or cam loading should be referred to Application Engineering for review.

## Cam Follower and Track Roller Bearing Lubrication

Standard series cam followers and track rollers as listed are factory filled with an NLGI 2 grease suitable for operating temperatures of -20°F to +250°F. Consult Application Engineering regarding grease compatibility issues.

Series	Type
CF, CFH, CYR, CFD, CYRD, MCF, MCYR, MCFD, MCYRD,	Lithium Soap
SDCF, SDMCF	Lithium Complex Soap
PCF, PCYR, FCF, FCYR, VCF, VCYR (Ball Bearing)	Lithium Soap
PCF, PCYR, FCF, FCYR, VCF, VCYR (Tapered Roller Bearing)	Polyurea
BCF, BCYR	Not grease lubricated, coated with preservative oil.
CF-CR, CYR-CR	Aluminum Complex Soap USDA H-1 Authorized*

\* Authorized by USDA for use in federally inspected meat and poultry plants. USDA H-1 authorized lubricants may be used on equipment as a lubricant or anti-rust film in locations in which there is exposure of the lubricated part to the edible product.

Frequency of lubrication depends primarily upon the speed of rotation of the bearing, the type of lubrication employed and the amount of contamination present in the application. It is possible to achieve extended operating life without lubrication where speeds are low and contamination is not excessive. This is primarily true in track support applications where bearing rotation is intermittent.

For continuously rotating applications, it is necessary to either provide continuous oil lubrication or else frequent grease lubrication, depending upon the severity of service. Automatic lubrication devices are ideal for intermittent lubrication, since accurate metering of grease and consistent relubrication is maintained through the use of these devices. In applications involving paper dust and other similar abrasive contaminants, relubrication must be resorted to at more frequent intervals and Application Engineering should be consulted for these critical applications. In LUBRI-DISC® sealed cam followers and track rollers, small vents or reliefs are provided in each seal to enable relubrication of the bearing. To avoid loss of seal efficiency, these seal vents are kept as small as possible, and for this reason the rate of relubrication should be kept at lower levels to avoid seal displacement.

## Cam Follower Engineering Section continued

### Reduced Maintenance Cam Followers and Track Rollers

Series CFD, CYRD, SDCF, SDMCF, PCF, FCF, VCF cam followers and track rollers are designed for use without relubrication and are not provided as standard with provisions for relubrication. These types of bearings may be limited by the life of the original grease fill and the ability of the seals to protect the bearing from contamination.

### Lubrication of Stud-Type Cam Followers and Track Rollers

Series CF, CFH, CF-CR, MCF and MCFD cam followers and track rollers with integral studs are supplied with potential for 3 alternate means of lubrication; namely, through either end of the stud with an appropriate grease fitting or through the radial hole in the stem of the stud.

- The four smallest sizes in inch series CF, CFH, CF-CR (1/2, 9/16, 5/8 and 11/16) and the three smallest sizes in metric series MCF (13, 16 and 19) are an exception to the above information, since they contain neither the radial oil hole in the stem nor the axial hole at the threaded end of the stud. Therefore, these bearings may only be lubricated from the flange end of the stud in the screwdriver slot type only.
- The radial oil hole is not present in metric series MCF sizes through 26 mm OD.
- Bearings utilizing the hex hole feature, unless noted otherwise on the dimension tables, do not have the axial lubrication hole present at that end.

Since in most cam followers two axial lubrication holes are provided, it is necessary to plug one or both of the holes, depending upon the type of relubrication means employed. For this purpose, oil hole plugs are provided in the bearing wrapping and may be press fitted in the reamed lubrication fitting hole. They are designed to withstand normal relubrication pressures. If the stem radial oil hole is present but not used for relubrication, it should be covered by the housing; therefore, no plug is supplied for this hole.

### Grease Lubrication Fittings

Series CF, CFH, CF-CR

Basic Bearing No. Bearing Size	Drive Fitting Size	Ref. Alemite No.	Fitting Included
1/2 to 11/16 incl.	1/8"	3019	No
3/4 to 2 3/4 incl.	3/16"	1728-B	No
3 to 4 incl.	1/4"	1743-B	Yes*
5 to 10 incl.	1/4" NPT	1627-B	No
* For hex hole option only.			

Series MCF, MCFD

Basic Bearing No. Bearing Size	Drive Fitting Size	Fitting Included mm
13	3.1	Yes
16 to 26 incl.	4	Yes
30 to 40 incl.	6	Yes
47 to 90 incl.	8	Yes

### Lubrication of Yoke-Type Cam Followers and Track Rollers

The relubrication of yoke-type cam follower and track roller bearings is straight forward and is accomplished by means of a radial oil hole and annular lubrication groove found on the inner race of the bearing series. The mounting pin for this bearing series must be drilled axially and radially to properly line up with the groove and hole of the CYR bearing inner race to effect proper lubrication.

# Cam Follower Engineering Section continued

## Mounting Details - Stud Type Cam Followers and Track Rollers

### Series CF, CFH, BCF, CF-CR, CFD, MCF, MCFD

Proper mounting of stud type cam follower and track roller bearings require a close fit between the bearing stud and the housing hole. The endplate must be backed up by the housing member face. Likewise the face of the housing adjacent to the bearing endplate face should be square to the housing bore. The following are some general guidelines and details to bear in mind when installing the above series' bearings.

#### 1. Inspect housing.

- Clean, remove burrs and sharp edges.
- Check housing bore diameter. The stud diameter should have a tight fit in the housing bore. Refer to the recommended housing bore diameters given in the dimensional tables.

#### 2. Press stud into housing.

- For best bearing performance, bearing should be mounted with raceway radial lubrication hole in the unloaded portion of the raceway. Raceway radial hole is oriented in line with stem radial hole.
- Direct pressure against solid end of stud, not against the flanged portion.
- Do not apply pressure against outer ring face.
- Use arbor press whenever possible.
- Do not hammer on bearing faces.

#### 3. Install nut and lock washer.

- Follow recommended clamping torque on dimensional table. Do not over tighten, otherwise undue stress may be set up in stud. Overtightening nut can also cause stretching of the stud diameter with consequent loosening of the stud in the housing member.
- A screwdriver slot is provided at the flanged end of the stud for the purpose of preventing the stud from turning when the nut is tightened. The bottom of the screwdriver slot is rounded and in some cases it may be necessary to use a special screwdriver having a rounded edge to hold the stud securely.
- An optional hexagonal hole is provided in the stud face on selected sizes for use with applications requiring greater than average thread torque or for ease of installation. In this modification, the ability to relubricate through the flange end of the stud, unless otherwise noted in the dimension tables, is eliminated.

## Cam Follower Engineering Section continued

### Blind Hole Mounting

Sometimes a stud type follower must be mounted where a nut and lock-washer cannot be used on the threaded portion. In such blind hole mountings, special care must be given to the fit-up of the stem in the housing.

- The drilling diameter used for tapping will generally result in a loose fit between the stud and housing hole. This can lead to premature fatigue fracture of the stud in applications with varying or reverse radial load. Press fitting the stud into a reamed hole without tapped threads would be better for these applications. The non-hardened stud can be retained by drilling and pinning, or by using a set screw to bear against the stud.
- Certain applications require blind hole mounting into tapped threads. The hex hole option should be used in these cases so that adequate torque can be applied to provide good endplate support.

Blind Hole Mounting

### Eccentric Bushing Mounting

Series CFE, BCFE, CFE-CR, SDCFE, SDMCFE, CFDE, MCFE, MCFDE, PCFE, FCFE, VCFE

In addition to the mounting details listed above, the following should be considered for proper mounting of stud type followers with the eccentric bushing option.

- The eccentric bushing diameter should have a .001" to .005" loose fit in the housing bore. Refer to dimensional table for specific housing bore diameter.

## Cam Follower Engineering Section continued

- For proper end-wise clamping, housing width must be .010" wider than bushing length.
- Lock-nut or lock washer and nut is sufficient to hold the bearing at the desired position for most applications.
- Where a more positive means of holding a given position is required, the bushing and stem can be drilled for pinning. Bushing and exposed stem area is unhardened steel.
- Hex hole option allows more positive grip for adjustment and locking.

### Series PCF, FCF, VCF, SDCF, SDMCF

These series cam followers and track rollers do not have an exposed stud face at the roller end. That face is enclosed by a metal plug assembled into the outer ring face. A loose stud fit in the housing is recommended so that minimal pressure is required to drive stud into the housing bore.

- Recommended housing bore fit for these series is .0005" to .0025" loose. Refer to dimensional table for specific housing bore diameter.
- A hex hole is provided at the threaded end of the stud for the purpose of holding the stud from turning when the nut is tightened.
- These series can not be tightened into a blind drilled and tapped hole.

### Mounting Details - Yoke Type Cam Followers and Track Rollers

#### Series CYR, CYR-CR, CYRD, MCYR, MCYRD

Endplate support is critical when mounting yoke-type series cam followers and track rollers. If the endplates are not properly backed up, they can be displaced from the inner ring. The preferred mounting method is to provide complete axial clamping of the endplates.

If the endplates can not be clamped end-wise, it is essential to have a close fit axially in the yoke in which the bearing is mounted to prevent the bearing endplates displacing axially.

## Cam Follower Engineering Section continued

The following are some general guidelines and details when installing yoke type followers.

- 1. Inspect housing.**
  - Clean, remove burrs and sharp edges.
- 2. Check shaft diameter size.**
  - Follow recommended shaft fits per table below. Refer to dimensional table for specific shaft diameter and tolerance.
- 3. Press shaft through bearing within yoke housing.**
  - For best bearing performance, mount follower with lubrication hole in the unloaded portion of the raceway.
  - Apply pressure towards center or below on endplate face if pressing bearing onto shaft.
  - Do not apply pressure against outer ring face.
  - Use abor press whenever possible.
  - Do not hammer on bearing faces.

### Shaft Fit Selection - Inch Series CYR, CYR-CR, CYRD

Load	End-Wise Clamped	Fit	Shaft Condition
Light	Yes	Push	Not Hardened
Medium	Yes	Push	Hardened
Heavy	Yes	Drive or Press	Hardened
Light	No	Press	Not Hardened
Medium	No	Press	Hardened
Heavy	No	Press	Hardened

### Shaft Fit Selection - Metric Series MCYR, MCYRD

Load	End-Wise Clamped	Fit	Shaft Condition
Light	Yes	g6	Not Hardened
Medium	Yes	g6	Hardened
Heavy	Yes	h6 or j6	Hardened
Light	No	j6	Not Hardened
Medium	No	j6	Hardened
Heavy	No	j6	Hardened

### Special Modified Cam Follower and Track Roller Bearings

McGill offers certain options for the CF, CFH and MCF series cam follower and track roller bearings with low minimum order quantity and short order lead time. Contact customer service for price and delivery information, 1-800-626-2120.

### Threaded Axial Lubrication Holes

Standard reamed axial hole is tapped to accommodate threaded lubrication fitting. This option is popular when using automatic lubrication systems.

# Cam Follower Engineering Section continued

## Specifications - Inch Series

Bearing OD Size	Thread Size
1/2 thru 11/16	Not Available
3/4 thru 1 3/8	1/4-28 UNF
1 1/2 thru 4	1/8 NPT

## Specifications - Metric Series

Bearing OD Size	Thread Size
13	Not Available
16 thru 26	M6 X 0.75
35 thru 90	1/8 NPT

## Axial Lubrication Holes Plugged

Options include threaded end, flange end or both ends of stud. Plugs are normally supplied loose in box. If the bearing is not to be lubricated in service, plugging the holes helps prevent entry of contamination. Bearings supplied with plugs installed saves user's time and provides a bearing ready to install.

## Hex Hole or Screwdriver Slot at Threaded End of Stud

These options are typically selected when roller end of stud is not accessible at installation.

## Annular Lubrication Groove at Stem Radial Hole

This option helps entry of lubricant through stud radial hole so that alignment of stem and housing lubrication holes is not critical

## Hex Wrench Sizes

Basic Bearing No.	Hex Wrench Sizes	Basic Bearing No.	Hex Wrench Sizes
1/2	1/8	1 7/8	5/16

# Needle

Unmounted bearing assembly consisting of through hardened precision machined inner and outer raceways with either full complement or separated (cage) needle rolling elements. Depending on the bearing configuration the retainer can be land or roller riding and available with several seal options. Machined race needle bearings provide an antifriction solution when supporting rotating shafts with radial loads.

## **Bearing Configurations**

Separable Or Non-Separable Inner/Outer Raceway

## **Shaft Diameter Range**

1/2" To 9 1/4" And 15 mm To 235 mm

## **Materials**

Bearing Quality Steel

## Needle Selection Guide

					SIZE RANGE

## McGill CAGEROL®

McGill CAGEROL® machined race needle bearings are manufactured from bearing quality steel. Most sizes use crowned, or end relieved, rollers to help reduce end stresses and allows for greater misalignment. The rollers are separated by a steel retainer (cage) to help achieve higher speeds and provide a lubricant reservoir. CAGEROL® bearings are constructed with radial lubrication hole and groove on the outer and optional inner raceway (MI-series) for relubrication through the housing or shaft. Other options include a variety of seal configurations to either help prevent contaminant entry or contain the lubricant. Depending on your preference, these bearings are available in a wide variety of sizes and sealing options as illustrated on the pages to follow.

Needle/Journal Bearings

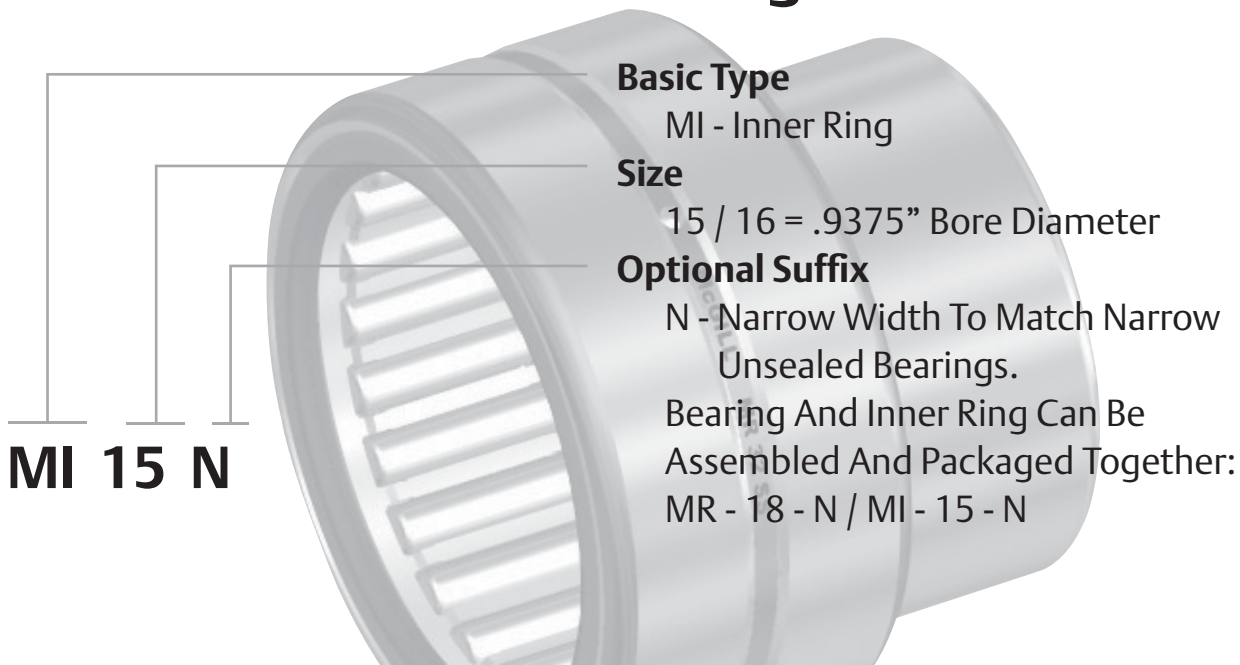

## CAGEROL® Nomenclature

## Inner Ring

## Features and Benefits

### Machined Outer Race

Race manufactured from bearing quality steel and hardened to carry heavy dynamic and static loads.

### Needle Rollers with End Relief (Most Sizes)

Precision Needle Rollers provide high radial load capabilities in small radial envelope dimension. End relief features help reduce raceway stress when shaft misalignment occurs.

### Steel Cage

Welded construction minimizes roller radial play for ease of assembly and provides roller guidance helping to reduce friction. The spacing provided by the retainer contributes to the high speed capabilities and lubricant reservoir within the bearing envelope.

### Annular Lubrication Groove

The groove provides a circumferential path to direct lubricant to the hole when lubricating through the housing.

### Factory Grease Fill

The Sealed CAGEROL bearings are factory lubricated with a medium temperature (-30° to 250°F, -34° to 121° C) NLGI 1 grease, unsealed bearings packaged with light oil film as a rust preventative. Contact Application Engineering when application conditions require special lubricants.

## Options

### Seals

The rubber lip seal is capable of 250° F maximum temperature and is available in several different configurations.

S

SS

RS

RSS

SRS

### “DS” Matched Bearings – Load Sharing

When two bearings are installed with the distance between both bearing less than the width of one bearing, it is recommended the bearings be diametrically matched to prevent unequal load sharing. The option, when applicable matches OD and ID tolerances, diametrical clearance within 30% of the tolerance range and the radial runout within 20% of the tolerance range with high point of runout indicated on the bearing faces. For more information and matching factors please review the engineering section for matched bearings. Matched bearings are packaged as sets.

### Machined Inner Ring (MI)

Precision ground inner ring provides a hardened raceway for the rollers when used with an unhardened shaft. The ring contains an oil hole and annular groove for relubrication of the bearing and can be used with both CAGEROL and GUIDEROL bearings or can be utilized as a bushing in plain bearing applications.

### Grease Options

When requested, standard bearings can be factory filled with customer specified lubricant.

Not all parts are available from stock. Please contact customer service for availability (800) 626-2120.  
For more information on bearing capabilities outside of our standard offering, please contact Application Engineering (800) 626-2093.

# McGILL® CAGEROL® Bearings

Needle/Journal Bearings

- Basic Construction Type:** Machined Race With Optional Separable Inner Ring
- Rolling Elements:** Cage Guided Precision Needles
- Bearing Material:** Bearing Quality Steel
- Seal Type:** Rubber Lip
- Lubrication:** Sealed Bearings: Lithium Soap Grease NLGI #1 Unsealed Bearings: Rust Preventative

Metric dimensions for reference only.  
 For sealed bearings, Outside diameter may be slightly oversize due to seal press fit.  
 For DS matching as DS suffix to part number  
 \* For bearing properly filled with #1 grease reduce speed by 50%

Not all parts are available from stock. Please contact customer service for availability (800) 626-2120.  
For more information on bearing capabilities outside of our standard offering, please contact Application Engineering (800) 626-2093.

**Basic Construction Type:** Machined Race With Optional Separable Inner Ring

**Rolling Elements:** Cage Guided Precision Needles

**Bearing Material:** Bearing Quality Steel

**Seal Type:** Rubber Lip

**Lubrication:** Sealed Bearings: Lithium Soap Grease NLGI #1  
Unsealed Bearings: Rust Preventative

For sealed bearings, Outside diameter may be slightly oversize due to seal press fit.

For DS matching as DS suffix to part number

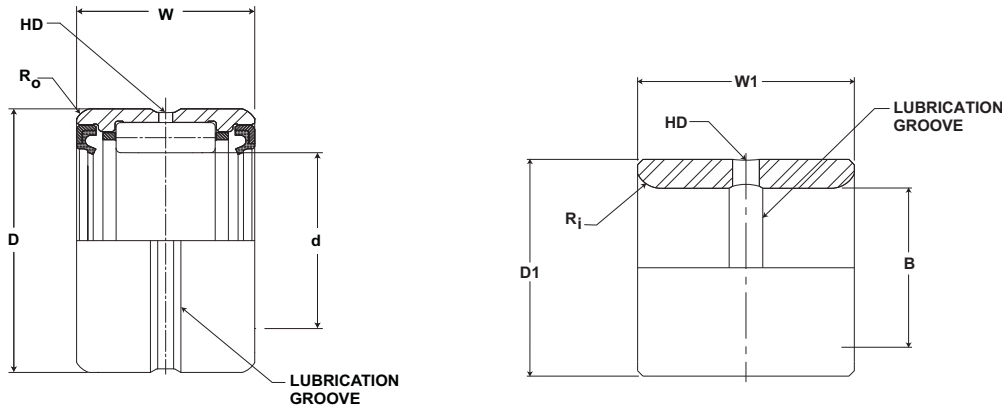

\* For bearing properly filled with #1 grease reduce speed by 50%

† Not available from stock. Consult McGill customer service for availability.

Metric dimensions for reference only.

Not all parts are available from stock. Please contact customer service for availability (800) 626-2120.

For more information on bearing capabilities outside of our standard offering, please contact Application Engineering (800) 626-2093.

For sealed bearings, Outside diameter may be slightly oversize due to seal press fit.

For DS matching as DS suffix to part number

\* For bearing properly filled with #1 grease reduce speed by 50%

## McGill GUIDEROL® Bearings

McGill GUIDEROL® machined race full complement needle bearings are manufactured from bearing quality steel with unique roller and race design to provide center-guided rolling elements for higher radial load capacity and is well suited for oscillating applications. GUIDEROL® bearings are constructed with radial lubrication hole and groove on the outer and optional inner raceway (MI-series) for relubrication through the housing or shaft. Other options include a variety of seal configurations to either help prevent contaminant entry or contain the lubricant. Depending on your preference, these bearings are available in a wide variety of sizes and sealing options as illustrated on the pages to follow.

## GUIDEROL® Nomenclature

## Inner Ring

## Features and Benefits

### Machined Outer Race

Race manufactured from bearing quality steel and hardened to carry heavy dynamic and static loads.

### Unique Center Guided Needle Rollers

Centered guided rollers designed to fit a mating guide rail and allow for maximum width of roller within the bearing.

### Retaining Ring and Center Rail

Provides retention of needle rollers and helps guide rollers to prevent skewing.

### Annular Lubrication Groove

The groove provides a circumferential path to direct lubricant to the oil hole, when lubricating through the housing.

### Factory Grease Fill

The sealed GUIDEROL® bearings are factory lubricated with a medium temperature (-30° to 250°F, -34° to 121° C) NLGI 1 grease, unsealed bearings packaged with light oil film as a rust preventative. Contact Application Engineering when application conditions require special lubricants.

## Options

### Seals

The rubber lip seal is capable of 250° F maximum temperature and is available in several different configurations on bearings capable being sealed.

S

SS

RS

RSS

SRS

### “DS” Matched Bearings – Load Sharing

When two bearings are installed with the distance between both bearing less than the width of one bearing, it is recommended the bearings be diametrically matched to prevent unequal load sharing. The option matches OD and ID tolerances, diametrical clearance within 30% of the tolerance range and the radial runout within 20% of the tolerance range with high point of runout indicated on the bearing faces. For more information and matching factors please review the engineering section for matched bearings. Matched bearings are packaged as sets, but can be used individually if desired.

### Machined Inner Ring (MI)

Precision ground inner ring provides a hardened raceway for the rollers when used with an unhardened shaft. The ring contains an oil hole and annular groove for relubrication of the bearing and can be used with both CAGEROL and GUIDEROL bearings or can be utilized as a bushing in plain bearing applications.

### Grease Options

When requested, standard bearings can be factory filled with customer specified lubricant.

# McGILL® GUIDEROL® Bearings

Needle/Journal Bearings

- Basic Construction Type:** Machined Race with full Complement of Needles
- Rolling Elements:** Center Guided Precision Needles
- Bearing Material:** Bearing Quality Steel
- Seal Type:** Rubber Lip
- Lubrication:** Sealed Bearings: Lithium Soap Grease NLGI #1  
Unsealed Bearings: Rust Preventative

For sealed bearings, Outside diameter may be slightly oversize due to seal press fit.  
For DS matching as DS suffix to part number  
\* For bearing properly filled with #1 grease reduce speed by 50%

Metric dimensions for reference only.  
Not all parts are available from stock. Please contact customer service for availability (800) 626-2120.  
For more information on bearing capabilities outside of our standard offering, please contact Application Engineering (800) 626-2093.

# McGILL® GUIDEROL® Bearings

Needle/Journal Bearings

**Basic Construction Type:** Machined Race with full Complement of Needles

**Rolling Elements:** Center Guided Precision Needles

**Bearing Material:** Bearing Quality Steel

**Seal Type:** Rubber Lip

**Lubrication:** Sealed Bearings: Lithium Soap Grease NLGI #1  
Unsealed Bearings: Rust Preventative

# McGILL® GUIDEROL® Bearings

Needle/Journal Bearings

- Basic Construction Type:** Machined Race with full Complement of Needles
- Rolling Elements:** Center Guided Precision Needles
- Bearing Material:** Bearing Quality Steel
- Seal Type:** Rubber Lip
- Lubrication:** Sealed Bearings: Lithium Soap Grease NLGI #1  
Unsealed Bearings: Rust Preventative

# McGILL® GUIDEROL® Bearings

Needle/Journal Bearings

- Basic Construction Type:** Machined Race with full Complement of Needles
- Rolling Elements:** Center Guided Precision Needles
- Bearing Material:** Bearing Quality Steel
- Seal Type:** Rubber Lip
- Lubrication:** Sealed Bearings: Lithium Soap Grease NLGI #1  
Unsealed Bearings: Rust Preventative

For sealed bearings, Outside diameter may be slightly oversize due to seal press fit.

For DS matching as DS suffix to part number

\* For bearing properly filled with #1 grease reduce speed by 50%

Metric dimensions for reference only.

Not all parts are available from stock. Please contact customer service for availability (800) 626-2120.

For more information on bearing capabilities outside of our standard offering, please contact Application Engineering (800) 626-2093.

## McGill Machined Inner Ring

Precision ground inner ring provides a hardened raceway for the rollers when used with an unhardened shaft. The ring contains an oil hole and annular groove for relubrication of the bearing and can be used with both CAGEROL and GUIDEROL bearings or can be utilized as a bushing in plain bearing applications.

Needle/Journal Bearings

**Basic Construction Type:** Thru Hardened Precision Ground Rings

**Ring Material:** Bearing Quality Steel

## McGill MULTI-ROL Needle Bearings

Full complement needle bearing provides high radial load rating with good shaft support, angular rigidity, and is dimensionally equivalent to most plain bearings with bronze or babbitt bushing. Available in both single and two row designs with non separable inner race and metallic shields for pure radial load applications. The angular lube groove provides a circumferential path to direct lubricant to the oil hole.

Needle/Journal Bearings

- Basic Construction Type:** Full Complement Machined Race Needle Bearing and Non Separable Inner Ring
- Rolling Elements:** Single Row Precision Ground Needle
- Bearing Material:** Bearing Quality Steel
- Seal Type:** Metallic Shield

## Rollway Journal Roller Bearings

Rollway Journal bearings feature through hardened bearing quality steel raceways, with an oil hole in the outer raceway, “trunion style” rollers, and a non-separable steel retainer (cage) assembly. The bearing design is well suited for high radial load, low speed applications. Rollway Journal bearings are available as components or complete assemblies and conform to industry dimensions and manufactured with Rollway quality standards. Depending on your preference, these bearings are available in a wide variety of sizes and options as illustrated on the pages to follow.

Needle/Journal Bearings

## Features and Benefits

### Precision Ground Races and Rollers

Races and Rollers are manufactured from high quality, bearing grade steel and are hardened to Rc 58 minimum.

### Roller Assembly

Roller assemblies have flush ground ends and heavy duty built-up retainers featuring steel stay rods rigidly held between stamped steel endplates.

### Oil Holes

All outer rings are supplied with oil holes in the outer race to allow lubrication.

## Load Ratings and Life

### Life Calculations

The L10 (rating) life for any given application and bearing selection can be calculated in terms of millions of revolutions by using the bearing Basic Dynamic Rating and applied radial load (or, equivalent radial load in the case of radial bearing applications having combined radial and thrust loads). The L10 life for any given application can be calculated in terms of hours, using the bearing Basic Dynamic Rating, applied load (or equivalent radial load) and suitable speed factors, by the following equation:

$$L_{10} = \left(\frac{C}{P}\right) \times \frac{1,000,000}{60 \times n} = \left(\frac{C}{P}\right)^{10/3} \times \frac{16667}{n}$$

Where:

$L_{10}$  = The # of hours that 90% of identical bearings under ideal conditions will operate at a specific speed and condition before fatigue is expected to occur.

C = Basic Dynamic Rating (lbs)  
1,000,000 Revolutions

P = Constant Equivalent Radial Load (lbs)

n = Speed (RPM)

Additionally, the ABMA provides application factors for all types of bearings which need to be considered to determine an adjusted Rated Life ( $L_{na}$ ). L10 life rating is based on laboratory conditions yet other factors are encountered in actual bearing application that will reduce bearing life.  $L_{na}$  life rating takes into account reliability factors, material type, and operating conditions.

$$L_{na} = a_1 \times a_2 \times a_3 \times L_{10}$$

Where:

$L_{na}$  = Adjusted Rated Life.

$a_1$  = Reliability Factor. Adjustment factor applied where estimated fatigue life is based on reliability other than 90% (See Table No 1).

Table No. 1 Life Adjustment Factor for Reliability

Reliability %	$L_{na}$	$a_1$
90	L10	1
95	L5	0.62
96	L4	0.53
97	L3	0.44
98	L2	0.33
99	L1	0.21
50	L50	5

$a_2$  = Material Factor. Life adjustment for bearing race material. Regal Power Transmission Solutions bearing races are manufactured from bearing quality steel. Therefore the  $a_2$  factor is 1.0.

$a_3$  = Life Adjustment Factor for Operating Conditions. This factor should take into account the adequacy of lubricant, presence of foreign matter, conditions causing changes in material properties, and unusual loading or mounting conditions. Assuming a properly selected and mounted bearing having adequate seals and lubricant operating below 250°F and tight fitted to the shaft, the  $a_3$  factor should be 1.0.

## Load Ratings and Life Continued

Vibration and shock loading can act as an additional loading to the steady expected applied load. When shock or vibration is present, an a3 Life Adjustment Factor can be applied. Shock loading has many variables which often are not easily determined. Typically, it is best to rely on one's experience with the particular application. Consult Application Engineering for assistance with applications involving shock or vibration loading.

The a3 factor takes into account a wide range of application and mounting conditions as well as bearing features and design. Accurate determination of this factor is normally achieved through testing and in-field experience. Regal Power Transmission Solutions offers a wide range of options which can maximize bearing performance. Consult Application Engineering for more information.

### Variable Load Formula

Root mean load (RML) is to be used when a number of varying loads are applied to a bearing for varying time limits. Maximum loading still must be considered for bearing size selection.

$$\text{RML}^* = \sqrt[10/3]{\frac{(L_1^{10/3} N_1) + (L_2^{10/3} N_2) + (L_3^{10/3} N_3)}{100}}$$

Where:

RML = Root Mean Load (lbs.)

L<sub>1</sub>, L<sub>2</sub>, etc. = Load in pounds

N<sub>1</sub>, N<sub>2</sub>, etc. = Percent of total time operated at loads L<sub>1</sub>, L<sub>2</sub>, etc.

\* Apply RML to rating at mean speed to determine resultant life.

### Mean Speed Formula

The following formula is to be used when operating speed varies over time.

$$\text{Mean Speed} = \frac{S_1 N_1 + S_2 N_2 + S_3 N_3}{100}$$

S<sub>1</sub>, S<sub>2</sub>, etc = Speeds in RPM

N<sub>1</sub>, N<sub>2</sub>, etc = Percentage of total time operated at speeds S<sub>1</sub>, S<sub>2</sub>, etc

## Load Ratings and Life Continued

### Bearing Life In Oscillating Applications

The equivalent rotative speed (ERS) is used in life calculations when the bearing does not make complete revolutions during operation. The ERS is then used as the bearing operating speed in the calculation of the L10 (Rating) Life. The formula is based on sufficient angular rotation to have roller paths overlap.

$$\begin{aligned} \text{ERS} &= \text{Equivalent Rotative Speed} \\ \text{N} &= \text{Total number of degrees per minute through} \\ &\quad \text{which the bearing will rotate.} \\ \text{ERS} &= \frac{\text{N}}{360} \end{aligned}$$

In the above formula, allowance is made for the total number of stress applications on the weakest race per unit time, which, in turn, determines fatigue life and the speed factors. The theory behind fretting corrosion is best explained by the fact that the rolling elements in small angles of oscillation retrace a path over an unchanging area of the inner or outer races where the lubricant is prevented by inertia from flowing in behind the roller as the bearing oscillates in one direction. Upon reversal, this small area of rolling contact is traversed by the same roller in the dry state. The friction of the two unlubricated surfaces causes fretting corrosion and produces failures which are unpredictable from a normal life standpoint.

With a given bearing selected for an oscillating application, the best lubrication means is a light mineral oil under positive flow conditions. With a light oil, there is a tendency for all areas in the bearing load zone to be immersed in lubricant at all times. The full flow lubrication dictates that any oxidized material which may form is immediately carried away by the lubricant, and since these oxides are abrasive, further wear tends to be avoided. If grease lubrication must be used, it is best to consult with either the bearing manufacturer or the lubricant manufacturer to determine the best possible type of lubricant. Greases have been compounded to resist the detrimental effect of fretting corrosion for such applications.

### Static Load Rating

The “static load rating” for rolling element bearings is that uniformly distributed static radial load acting on a non-rotating bearing, which produces a contact stress of 580,000 psi (roller bearings) or 607,000 psi (ball bearings) at the center of the most heavily loaded rolling element. At this stress level, plastic deformation begins to be significant. Experience has shown that the plastic deformation at this stress level can be tolerated in most bearing applications without impairment of subsequent bearing operation. In certain applications where subsequent rotation of the bearing is slow and where smoothness and friction requirements are not too exacting, a higher static load limit can be tolerated. Where extreme smoothness is required or friction requirements are critical, a lower static load limit may be necessary.

### Minimum Bearing Load

Skidding, or sliding, of the rolling elements on the raceway instead of a true rolling motion can cause excessive wear. Applications with high speeds and light loading are particularly prone to skidding. As a general guideline, rolling element bearings should be radially loaded at least 2% of Basic Dynamic Rating. For applications where load is light relative to the bearings dynamic load rating, consult Application Engineering for assistance.

## Load Ratings and Life Continued

### Needle Roller Bearings Selection - New Applications:

Example #1:

To find theoretical L10 life of an MR 16 bearing operating at a speed of 500 RPM and under a load of 1000 lbs.

Basic Dynamic Rating of MR-16 = 8000 lbs. Use Formula:

$$L_{10} = \frac{16,666}{N} \left( \frac{BDR}{P} \right)^{10/3}$$

$$L_{10} = \frac{16,666}{500} \left( \frac{8000}{1000} \right)^{10/3}$$

$$L_{10} = 34,132 \text{ hours}$$

Example #2:

Find the Basic Dynamic Rating required for a CAGEROL<sup>®</sup> bearing operating at 1000 RPM, with a load of 700 pounds. The required L10 life will be 20,000 hours. Use the Formula:

$$BDR = .054 \times P \times (L_{10} \times N)^3$$

$$BDR = .054 \times 700 \times (20,000 \times 1000)^3$$

$$BDR = .054 \times 700 \times 155$$

$$BDR = 5859 \text{ lbs.}$$

## Needle Engineering Section

### Type of Load

The load ratings in this catalog are based on uniform and steady loading. When the loading is of a shock nature and/or vibration is present, or the loading is indeterminate, a bearing of greater rating must be selected. If such conditions exist, it is advisable to use the application Type of Load Factor as shown in the table below.

### Type of Load Factors

The actual bearing load should be multiplied by the appropriate load factor and the resultant value used to calculate the bearing life or to determine the required basic dynamic rating (BDR).

Type of Load	Factor C
Uniform and Constant	1.0
Light Shock	1.5
Moderate Shock	2.0
Heavy Shock	3.0

### Matched Bearings (MR, GR, RS, RD series only)

Where bearings are mounted so that the distance between them is less than the width of one bearing, it is recommended under heavy loading conditions to provide some degree of diametral matching in order to prevent unequal sharing of the applied load. Matching procedures have been developed to provide super precision matching of bearings. Bearings matched in this category are identified by "-DS" suffix for super precision.

- A. O.D. and I.D., where applicable, of matched bearings same diameters within 30% of the respective O.D. or I.D. tolerance.
- B. I.D. of rollers or diametral clearance, where applicable, of matched bearings same within 30% of the tolerance range.
- C. Radial runout of matched bearings same within 20% of the tolerance range.
- D. High point of radial runout marked on the face of each outer and inner ring.
- E. Matched bearings to be packaged as a unit.

Matching Factor	Matching Suffix
1 .37	None
1 .65	"-DS"

Multiply Matching Factor by rating of single bearing to obtain resultant rating for pair of bearings.

## Needle Engineering Section continued

### Shaft Materials and Their Treatment

In order to obtain the performance built into needle and radial roller bearings when applied without inner races, it is important that the bearing user employ the best possible shaft material and heat treatment.

This is especially critical in cases of outer race rotation where the shaft becomes the weakest member of the bearing assembly.

Manufacturing simplicity as well as reduced operating clearances can be obtained by omission of inner races with their extra expense, as well as build-up of tolerances. This construction is employed frequently in the application of needle bearings and to a somewhat lesser degree in radial roller bearings.

With the conventional application using inner races, the selection of shaft material is principally a matter of manufacturing economy coupled with proper bending and tensile strength, and in most cases surface heat treatments of shafts are dispensed with. However, when the inner race is eliminated, the shaft then becomes an integral member of the bearing and the three following areas must be accurately and correctly covered for best bearing performance:

1. Shaft material selection.
2. Shaft heat treatment.
3. Shaft surface finish.

Under item 1, there are a number of satisfactory shaft materials which can be employed and they can be broken down into two groups as follows:

1. Thru-hardening or induction hardening material.
2. Case hardening material.

Where thru-hardening or induction hardening materials are employed, a sound material would be SAE 52100 steel, such as employed by the bearing manufacturers. This material may be induction zone hardened, or thru-hardened in accordance with the dictates of the application. However, as shaft material in the thru-hardened state, the high core hardness of the 52100 steel causes brittleness that may be objectionable.

Zone hardening or induction hardening that provides a tougher core is usually more satisfactory for shaft applications. Alternate materials, such as SAE 1050, SAE 1150 may be used, employing the induction or flame hardening process. While these steels will induction harden satisfactorily to give the proper hardness ranges, they will not offer the fatigue resistance of the higher alloy content steels.

Examples of higher alloy steels are SAE 4650, SAE 8650, etc. These materials do not require carburization for induction hardening. However, as mentioned above, the absence of excess carbides in the surface structure of the material after heat treatment reduces the fatigue life of the material correspondingly. Hardnesses in the range of 60 HRC should be maintained under all circumstances.

## Needle Engineering Section continued

For case hardening, any number of materials can be employed, ranging from the plain carbon SAE 1010 to 1020 up through SAE 4615, 4620, 8615 and 8620. Shafts can be completely carburized and case hardened or zone hardened by masking or copper plating areas desired left in soft state. A minimum hardness of 58 HRC should be employed. For the best quality of heat treatment, it is imperative that the hardening temperature in both the induction and thru-hardening process be held to rather close limits, in order to avoid the formation of retained austenite. In water quenching of induction hardened steels, the cracking of shafts after treatment should be avoided by immediate tempering. Contact Application Engineering for assistance in determining minimum required case depths.

A practical maximum surface finish for shafts being used as inner races would be 12 micro inches RA. Rougher surface finishes can be employed; however, the user will run the risk of more erratic performance due to the wearing in of the shaft as well as a lesser control of dimensional accuracy of the mounted bearing. All bearings wear in to a certain extent and the amount of "wear-in" depends directly upon the surface finish of the mating parts. The rougher the surface the greater the "wear-in" and the greater range of resultant clearance which would ensue.

### MR and GR Series Bearing Lubrication

Sealed MR and GR series bearings are factory filled with an NLGI 1 lithium soap thickened grease suitable for operating temperatures of -20°F to +250°F. Unsealed MR, GR, RS, RD and MI inner rings are coated with a corrosion preventive oil. Consult Application Engineering regarding grease compatibility issues.

MR and GR series bearings have a lubrication hole and annular groove centered on the outside diameter to allow relubrication of the bearing through the housing member. The MI inner ring has a lubrication hole and annular groove centered in the bore diameter to allow relubrication of the bearing through the shaft member.

When sealed MR and GR series bearings are to be relubricated, it is recommended that the RS, SRS or RSS seal arrangement is used. These arrangements locate a seal lip outward and allows excess and used grease to vent during relubrication.

Frequency of lubrication depends primarily upon the speed of rotation of the bearing, the type of lubrication employed and the amount of contamination present in the application. For continuously rotating applications, it is necessary to either provide continuous oil lubrication or else frequent grease lubrication, depending upon the severity of service. Automatic lubrication devices are ideal for intermittent lubrication, since accurate metering of grease and consistent relubrication is maintained through the use of these devices. Best determination of relubrication interval can be made by testing or experience in the application. Contact Application Engineering for assistance in determining relubrication interval.

### Mounting Details - Heavy-Duty Needle Roller Bearings Series McGill MR, GR, MI, RS, RD, and Rollway Journal Bearings

Proper mounting of CAGEROL® and GUIDEROL® heavy-duty needle roller bearings generally require a press fit of the ring rotating relative to the radial load. A close to loose fit is used for the ring stationary relative to the radial load. Specific shaft and housing diameters are listed in the respective series dimension tables.

## Needle Engineering Section continued

For Rollway Journal bearing applications, a rotating shaft is the predominant method of operation. Therefore, recommended shaft and housing tolerances are provided for applications with a rotating shaft only. For Journal applications which require a rotating housing, please consult Application Engineering for specific Journal bearing shaft and housing fits.

The following are some general guidelines and details to bear in mind when installing these bearing series:

**1. Inspect housing and shaft.**

- Clean, remove burrs and shaft edges.
- If any damage has occurred to the bearing seat in the housing or on the shaft, repair that damage to bring the seat surfaces back to its original condition.

**2. Determine which member, shaft or housing, has an interference fit with the bearing.**

- In general, the ring rotating relative to the radial load has an interference fit.
- Refer to dimension tables for specific shaft and housing diameters.

**3. Install the bearing onto the press-fitted member by applying force against the bearing ring that is press-fitted.**

- For a press-fitted inner ring, apply the force required to assemble the bearing onto the shaft against the face of the bearing inner ring.
- For a press-fitted outer ring, apply the force required to assemble the bearing into the housing against the face of the bearing outer ring.
- Care should be exercised to assure that the bearing starts onto the press-fitted member as squarely as possible.
- Use arbor press whenever possible.
- Do not hammer on bearing ring face.

**4. Inner rings press-fitted on the shaft may be more easily installed onto the shaft by heating the ring and causing it to shrink-fit.**

- Normally, heating the ring to 175°F to 212°F (70°C to 100°C) will be sufficient to allow the ring to slide over the interference fit shaft seat.
- Heating the ring should be accomplished with an induction heater or in an oil bath. Never use a torch to heat a bearing for assembly purposes.

**5. When outer rings are to be press-fitted into a housing, it is desirable to heat the housing to allow it shrink-fit onto the outer ring outside diameter.**

- Freezing the bearing to shrink it for easy assembly into a press-fitted housing is not recommended. Water condensation can form inside the bearing upon its return to room temperature, which can lead to corrosion. Exposure to extreme cold can also affect the metallurgical structure of the bearing.

**6. After mounting is complete, the assembly should be inspected to insure that it rotates freely, without unusual drag or noise.**

# *Spherical Roller*

Unmounted bearing assembly consisting of through hardened inner and outer raceways with single spherical rolling elements separated by steel land riding retainer (cage) and available with several seal options. SPHERE-ROL® roller bearings provide an antifriction solution when supporting rotating shafts with combination radial and thrust loads.

## **Bearing Configurations**

Sealed / unsealed, straight or tapered bore

## **Bore Diameter Size Range**

20 mm to 150 mm (.5906" to 5.9055")

## **Materials**

Bearing Quality Steel

## Spherical Roller Selection Guide

Sphere-Rol Bearings

		SIZE RANGE			
		Product Series	Material / Roller Complement	Metric	Inch Equiv
SHERE-ROL		22200 Series	Bearing Steel Spherical Roller	20 - 150	.7674 - 5.9055
		22300 Series	Bearing Steel Spherical Roller	40 - 100	1.5748 - 3.9370

\* For estimating purpose only, individually sizes may vary and are subject to change without notification

DESIGN CHARACTERISTICS				Features

## McGill SPHERE-ROL® Spherical Bearings

McGill SPHERE-ROL® Bearings feature an optimal diameter of single row spherical rollers separated by a land riding steel retainer within a dimensionally interchangeable (ABMA/ISO specification) envelope. In addition, SPHERE-ROL® bearings feature NYLAPLATE®, NYLAPLATE high temperature and LAMBDA® seal options and misalignment capabilities, further differentiating SPHERE-ROL® bearings from other types. The bearing design and use of tapered bore with adapter option provide diametrical clearance control and installation ease. Depending on your preference, these bearings are available in a wide variety of sizes, clearances and sealing options as illustrated on the pages to follow.

Sphere-Rol Bearings

## SPHERE-ROL® Nomenclature

Sphere-Rol Bearings

### Misalignment Capability

As a result of the design geometry, SPHERE-ROL® bearings offer up to  $\pm 3^\circ$  misalignment in unsealed versions.

### Annular Lubrication Groove and Holes

The groove provides a circumferential path to direct lubricant and to the two oil holes.

### Spherical Roller

Precision spherical rollers provide high radial load capability, while providing the space necessary for seal options within a standard envelope dimension. The design of the roller provides a higher dynamic load rating and optimizes the number of maximum diameter rollers.

### Inner Ring Raceway Flanges

Provide roller guidance and surface to support retainer. The raceway width, or distance between the two flanges, also helps define a designed endplay in the bearing. For applications requiring compensation for shaft growth due to linear thermal expansion, SPHERE-ROL bearings are available with increased internal endplay identified by the expansion type(E) option.

### Steel Cage

The spacing provided by the heat treated steel cage contributes to the high speed capabilities and provides a lubricant reservoir within the bearing envelope.

## Features and Benefits continued

### Combination Load Capacity

The SPHERE-ROL® bearing design allows for high radial load capacity and the ability to accommodate a thrust load in combination with a radial load. Thrust load capability is proportional to the amount of radial load and pure thrust loads are not recommended. Typically a ratio less than .20 of axial to radial loads ( $F_a/F_r < .20$ ) is appropriate for SPHERE-ROL bearings, equivalent load formulas specified in the Engineering Section of this catalog.

### Factory Grease Fill

The sealed SPHERE-ROL bearings are factory lubricated with a medium temperature (-30° to 250°F, -34° to 121° C) Polyurea E.P. grease. Unsealed bearings packaged with light oil film as a rust preventative. Contact Application Engineering when application conditions require special lubricants.

## Options

### “S or SS” Nylaplate Seal

Combination labyrinth and contact seal is capable of 300° F maximum temperature. Bearing misalignment should not to exceed  $\pm 2^\circ$  in operation for best seal performance. When ordering seals for tapered bore (-K option) bearing, indication of which side to be sealed must be provided. The “L” in the option suffix defines a seal installed on larger bore diameter side of the taper, no indication will default to seal installed on small bore side.

### “TS or TSS” Nylaplate High Temperature Seal

Combination labyrinth and contact seal for operating temperatures up to 450°F. Bearing misalignment should not to exceed  $\pm 2^\circ$  in operation for best seal performance. Bearings with this seal option will include a high temperature grease fill designated by the VA grease suffix in the part number. When ordering seals for tapered bore (-K option) bearing, indication of which side to be sealed must be provided. The “L” in the option suffix defines a seal installed on larger bore diameter side of the taper, no indication will default to seal installed on small bore side.

## Options continued

### “YS or YSS” Lambda Seal

Utilizes a Nylaplate seal with an added contact seal for greater lip wiping seal function. Bearing misalignment should not exceed  $\pm 1/2^\circ$  in operation for best seal performance and maximum  $\pm 1^\circ$ . When ordering seals for tapered bore (-K option) bearing, indication of which side to be sealed must be provided. The “L” in the option suffix defines a seal installed on larger bore diameter side of the taper, no indication will default to seal installed on small bore side.

### “E”Expansion – Type E

A special version of the SPHERE-ROL bearing can be provided to accommodate expansion (float) internally to the bearing. The bearing design allows the SPHERE-ROL bearing to be the only spherical roller to have this ability, but does have a 10% reduction in BDR. Typically, application requiring tolerance for linear shaft expansion will have an expansion (Float) and non-expansion (fixed) position as mounted on a common shaft. The expansion-type SPHERE-ROL bearing will not operate satisfactorily if subjected to thrust loading. Therefore, the expansion-type SPHERE-ROL bearing must not be used in “fixed” (“held”) positions—it is for use only in “expansion” (“float”) positions. It is recommended that the end-wise restraint of both race rings of the expansion-type bearing be provided, so that the expansion allowance intended to be available is not lost by error in installation

### “K” Tapered bore bearing

SPHERE-ROL bearings are available with tapered bore feature for applications utilizing tapered adapter sleeve mounting arrangements or tapered shaft seats. This feature facilitates the mounting of SPHERE-ROL bearings and can be used to prevent the necessity for heating of bearings or to eliminate the need for complicated press fitting practices. Standard tapered adapter sleeves, as well as associated lock nuts and lock washers, are tabulated within the engineering section and are identifiable with the appropriate bearing by the suffix number. The separate items may be called out individually by their part number or the complete tapered bore bearing and associated hardware may be identified by the suffix letter “A” following the bearing number. The standard bore taper of these bearings is 1” in 12”, on the diameter, and tapered bore bearings are themselves identified by the suffix letter “K” following the basic bearing number.

## Options continued

### Diametral Clearance

SPHERE-ROL® bearings are available in internal diametral clearance ranges identified as C2, Standard, C3 and C4. The internal diametral clearances are progressively less than the Standard, while C3 and C4 are progressively looser than Standard. Similarly, four internal clearance ranges are available for tapered bore SPHERE-ROL® bearings. Each of these ranges is somewhat looser than the corresponding cylindrical bore bearing internal diametral clearance range, because of the need to accommodate a somewhat tighter fit with the tapered bore mounting arrangement. The following two charts give the internal diametral clearance ranges normally available with SPHERE-ROL® bearings from McGill. Stock bearings having standard diametral clearance will not be identified by special marking; however, the C2, C3 and C4 clearances will be identified on the bearing inner ring face, following the basic bearing number.

### “DS” Matched Bearings

When two SPHERE-ROL bearings are installed with the distance between both bearing less than the width of one bearing, it is recommended the bearings be diametrically matched to prevent unequal load sharing. The option, matches OD and ID tolerances, and Diametral Clearance with high point of runout indicated on the bearing faces. For more information and matching factors please review the engineering section for matched bearings.

### Grease Options

When requested, standard bearings can be factory filled with customer specified lubricant or industry equivalent.

# McGILL® SPHERE-ROL® Spherical Bearings

**Basic Construction Type:** 22200 Series Spherical Bearing With Non-Separable Inner Ring

**Rolling Elements:** Separated Spherical Rolling Elements

**Bearing Material:** Bearing Quality Steel

**Seal Type:** NYLAPLATE or LAMBDA

**Lubrication:** Sealed Bearings: Polyurea thickened NLGI 2 EP Grease.  
Unsealed Bearings: Corrosion Preventive Oil

Add K to base number indicate K bore option

Add W22 for select OD

All bearings are supplied with W33 option unless otherwise specified

\*Refers to oil lubrication and moderate load, use 50% of value for grease lubrication.

Complete adapter number indicated adapter sleeve, locknut, and washer, for components refer to S=sleeve, N= lock Nut, W= lock washer

For Expansion type bearing add E suffix immediately after diametrical clearance specification per nomenclature diagram.

For Sealing options see page D-8

Outside diameter may be oversized, due to internal retaining ring

Metric dimensions for reference only.

Not all parts are available from stock. Please contact customer service for availability (800) 626-2120.

For more information on bearing capabilities outside of our standard offering, please contact Application Engineering (800) 626-2093.

Add K to base number to indicate K bore option  
Add W22 for select OD  
All bearings are supplied with W33 option unless otherwise specified  
\*Refers to oil lubrication and moderate load, use 50% of value for grease lubrication.  
Complete adapter number indicated adapter sleeve, locknut, and washer, for components refer to S=sleeve, N= lock Nut, W= lock washer  
For Expansion type bearing add E suffix immediately after diametrical clearance specification per nomenclature diagram.  
For Sealing options see page D-8  
Outside diameter may be oversized, due to internal retaining ring

Metric dimensions for reference only.  
Not all parts are available from stock. Please contact customer service for availability (800) 626-2120.  
For more information on bearing capabilities outside of our standard offering, please contact Application Engineering (800) 626-2093.

# McGILL® SPHERE-ROL® Spherical Bearings

- Basic Construction Type:** 22300 Series Spherical Bearing With Non-Separable Inner Ring
- Rolling Elements:** Separated Spherical Rolling Elements
- Bearing Material:** Bearing Quality Steel
- Seal Type:** NYLAPLATE or LAMBDA
- Lubrication:** Sealed Bearings: Polyurea thickened NLGI 2 EP Grease.  
Unsealed Bearings: Corrosion Preventive Oil

Sphere-Rol Bearings

## Load Ratings and Life

### Life Calculations

The L10 (rating) life for any given application and bearing selection can be calculated in terms of millions of revolutions by using the bearing Basic Dynamic Rating and applied radial load (or, equivalent radial load in the case of radial bearing applications having combined radial and thrust loads). The L10 life for any given application can be calculated in terms of hours, using the bearing Basic Dynamic Rating, applied load (or equivalent radial load) and suitable speed factors, by the following equation:

$$L_{10} = \left(\frac{C}{P}\right) \times \frac{1,000,000}{60 \times n} = \left(\frac{C}{P}\right)^{10/3} \times \frac{16667}{n}$$

Where:

$L_{10}$  = The # of hours that 90% of identical bearings under ideal conditions will operate at a specific speed and condition before fatigue is expected to occur.

C = Basic Dynamic Rating (lbs)  
1,000,000 Revolutions

P = Constant Equivalent Radial Load (lbs)

n = Speed (RPM)

Additionally, the ABMA provides application factors for all types of bearings which need to be considered to determine an adjusted Rated Life ( $L_{na}$ ). L10 life rating is based on laboratory conditions yet other factors are encountered in actual bearing application that will reduce bearing life.  $L_{na}$  life rating takes into account reliability factors, material type, and operating conditions.

$$L_{na} = a_1 \times a_2 \times a_3 \times L_{10}$$

Where:

$L_{na}$  = Adjusted Rated Life.

$a_1$  = Reliability Factor. Adjustment factor applied where estimated fatigue life is based on reliability other than 90% (See Table No 1).

Table No. 1 Life Adjustment Factor for Reliability

Reliability %	$L_{na}$	$a_1$
90	L10	1
95	L5	0.62
96	L4	0.53
97	L3	0.44
98	L2	0.33
99	L1	0.21
50	L50	5

$a_2$  = Material Factor. Life adjustment for bearing race material. Regal Power Transmission Solutions bearing races are manufactured from bearing quality steel. Therefore the  $a_2$  factor is 1.0.

$a_3$  = Life Adjustment Factor for Operating Conditions. This factor should take into account the adequacy of lubricant, presence of foreign matter, conditions causing changes in material properties, and unusual loading or mounting conditions. Assuming a properly selected and mounted bearing having adequate seals and lubricant operating below 250°F and tight fitted to the shaft, the  $a_3$  factor should be 1.0.

## Load Ratings and Life Continued

Vibration and shock loading can act as an additional loading to the steady expected applied load. When shock or vibration is present, an a3 Life Adjustment Factor can be applied. Shock loading has many variables which often are not easily determined. Typically, it is best to rely on one's experience with the particular application. Consult Application Engineering for assistance with applications involving shock or vibration loading.

The a3 factor takes into account a wide range of application and mounting conditions as well as bearing features and design. Accurate determination of this factor is normally achieved through testing and in-field experience. Regal Power Transmission Solutions offers a wide range of options which can maximize bearing performance. Consult Application Engineering for more information.

### Combined Load – Single Row Spherical Roller Bearings

1. Calculate  $F_a/F_r$ .

When  $F_a/F_r \leq 0.12$  ;  $P = V F_r$

When  $F_a/F_r > 0.12$  ;  $P = 0.4V F_r + 5.0F_a$

$P$  = Equivalent radial load, lbs.

$F_r$  = Applied radial load, lbs.

$F_a$  = Applied thrust load, lbs.

$V$  = Rotation factor

= 1.0 for most applications

= 1.2 for vibratory applications

For applications involving combination loads in which  $F_a/F_r > 0.20$ , consult Application Engineering.

2. Calculate the L10 life using the life equation on page D-19.

## Load Ratings and Life Continued

### Variable Load Formula

Root mean load (RML) is to be used when a number of varying loads are applied to a bearing for varying time limits. Maximum loading still must be considered for bearing size selection.

$$RML^* = \sqrt[10/3]{\frac{(L_1^{10/3} N_1) + (L_2^{10/3} N_2) + (L_3^{10/3} N_3)}{100}}$$

Where:

RML = Root Mean Load (lbs.)

L<sub>1</sub>, L<sub>2</sub>, etc. = Load in pounds

N<sub>1</sub>, N<sub>2</sub>, etc. = Percent of total time operated at loads L<sub>1</sub>, L<sub>2</sub>, etc.

\* Apply RML to rating at mean speed to determine resultant life.

### Mean Speed Formula

The following formula is to be used when operating speed varies over time.

$$\text{Mean Speed} = \frac{S_1 N_1 + S_2 N_2 + S_3 N_3}{100}$$

S<sub>1</sub>, S<sub>2</sub>, etc = Speeds in RPM

N<sub>1</sub>, N<sub>2</sub>, etc = Percentage of total time operated at speeds S<sub>1</sub>, S<sub>2</sub>, etc

### Bearing Life In Oscillating Applications

The equivalent rotative speed (ERS) is used in life calculations when the bearing does not make complete revolutions during operation. The ERS is then used as the bearing operating speed in the calculation of the L10 (Rating) Life. The formula is based on sufficient angular rotation to have roller paths overlap.

ERS = Equivalent Rotative Speed

N = Total number of degrees per minute through which the bearing will rotate.

$$ERS = \frac{N}{360}$$

In the above formula, allowance is made for the total number of stress applications on the weakest race per unit time, which, in turn, determines fatigue life and the speed factors. The theory behind fretting corrosion is best explained by the fact that the rolling elements in small angles of oscillation retrace a path over an unchanging area of the inner or outer races where the lubricant is prevented by inertia from flowing in behind the roller as the bearing oscillates in one direction. Upon reversal, this small area of rolling contact is traversed by the same roller in the dry state. The friction of the two unlubricated surfaces causes fretting corrosion and produces failures which are unpredictable from a normal life standpoint.

## Load Ratings and Life Continued

With a given bearing selected for an oscillating application, the best lubrication means is a light mineral oil under positive flow conditions. With a light oil, there is a tendency for all areas in the bearing load zone to be immersed in lubricant at all times. The full flow lubrication dictates that any oxidized material which may form is immediately carried away by the lubricant, and since these oxides are abrasive, further wear tends to be avoided. If grease lubrication must be used, it is best to consult with either the bearing manufacturer or the lubricant manufacturer to determine the best possible type of lubricant. Greases have been compounded to resist the detrimental effect of fretting corrosion for such applications.

### Minimum Bearing Load

Skidding, or sliding, of the rolling elements on the raceway instead of a true rolling motion can cause excessive wear. Applications with high speeds and light loading are particularly prone to skidding. As a general guideline, rolling element bearings should be radially loaded at least 2% of Basic Dynamic Rating. For applications where load is light relative to the bearings dynamic load rating, consult Application Engineering for assistance.

## Spherical Engineering Section

### Equivalent Loads

When SPHERE-ROL® bearings operate under conditions of combined radial and thrust loads, an equivalent radial load must be calculated to determine resultant bearing life. SPHERE-ROL® bearings are not recommended for applications involving pure thrust loads; however, combination loads may be carried in accordance with the following equivalent radial load formulae:

$$\text{When } \frac{F_a}{F_r} \leq 0.12; P = VF_r$$

$$\text{When } \frac{F_a}{F_r} < 0.12; P = .4VF_r + 5.0 F_a$$

P = Equiv. radial load, lbs.

Fr = Applied radial load, lbs.

Fa = Applied thrust load, lbs.

V = Rotation factor

= 1.0 for most applications

= 1.2 for vibratory applications

For applications involving combination loads in which  $F_a/F_r > .20$ , consult Application Engineering.

### Static Load Rating

The "static load rating" is that uniformly distributed static radial bearing load which produces a maximum contact stress of 580,000 PSI, acting at the center of contact of the most heavily loaded rolling element. At this stress level, plastic deformation begins (or begins to be significant). Experience has shown that the plastic deformation at this stress level can be tolerated in most bearing applications without impairment of subsequent bearing operation. In certain applications where subsequent rotation of the bearing is slow and where smoothness and friction requirements are not too exacting, a higher static load limit can be tolerated. Where extreme smoothness is required or friction requirements are critical, a lower static load limit may be necessary.

When static bearings are subjected to both radial and thrust loads, the equivalent static radial load is defined as:

$$PO = 0.5 Fr + 4.0 Fa \text{ or}$$

$$PO = Fr \text{ whichever is greater.}$$

Contact Application Engineering for specific static load ratings, and applications involving pure static thrust loads.

# Spherical Engineering Section continued

## Matched Bearings

Where bearings are mounted so that the distance between them is less than the width of one bearing, it is recommended under heavy loading conditions to provide some degree of diametral matching in order to prevent unequal sharing of the applied load.

Matching procedures have been developed to provide super precision matching of bearings.

Bearings matched in this category are identified by "-DS" suffix for super precision.

- A. O.D. and I.D., where applicable, of matched bearings same diameters within 30% of the respective O.D. or I.D. tolerance.
- B. Diametral clearance, where applicable, of matched bearings same within 30% of the tolerance range.
- C. Radial runout of matched bearings same within 20% of the tolerance range.
- D. High point of radial runout marked on the face of each outer and inner ring.
- E. Matched bearings are packaged as a unit.

Matching Factor	Matching Suffix
1.55	None
1.71	"-DS"

Multiply Matching Factor by rating of single bearing to obtain resultant rating for pair of bearings.

## Diametral Clearance

SPHERE-ROL® bearings are available in four internal diametral clearance ranges identified as C2, Standard, C3 and C4. The C2 internal diametral clearance is less than the Standard, while C3 and C4 are progressively looser than Standard.

Similarly, four internal clearance ranges are available for tapered bore SPHERE-ROL® bearings. Each of these ranges is somewhat looser than the corresponding cylindrical bore bearing internal diametral clearance range, because of the need to accommodate a somewhat tighter fit with the tapered bore mounting arrangement.

The two charts below give the internal diametral clearance ranges normally available with SPHERE-ROL® bearings

Bearings having standard diametral clearance will not be identified by special marking; however, the C2, C3 and C4 clearances will be identified on the bearing inner ring face, following the basic bearing number. Consult Customer Service for availability on non-standard diametral clearances.

## Spherical Engineering Section continued

### Radial Clearance (inches) for “SB” Bearings with a Straight Bore

Basic Bore Diameter MM		Radial Clearance in Inches

### Expansion-Type SPHERE-ROL® Bearings

A special version of the SPHERE-ROL® bearing can be provided for applications requiring the bearing to accommodate expansion (float) internally. This “expansion-type” SPHERE-ROL® bearing is specified and identified by adding the suffix letter “E” immediately following the diametral clearance specification. (For instance, SB-22319-C3E-W33.)

Most applications incorporating two bearings on a common shaft require that one of those bearings be “fixed” and that the other be free to “float,” either in the housing seat bore or on the shaft seat. This float allowance, or expansion allowance, is required to compensate for variations in thermal expansion, or for linear dimension errors resulting from fabrication. In many cases, ordinary nonseparable ball or roller bearings are used for expansion but they are unsatisfactory because of housing or shaft seat diameter tolerances, the application of heavy loads or misalignment.

## Spherical Engineering Section continued

Self-aligning bearings are preferred and the expansion-type SPHERE-ROL® roller bearing is the only internally self-aligning bearings having the capability of accommodating expansion or float allowance internally.

This expansion-type SPHERE-ROL® bearing is dimensionally interchangeable, size for size, with "standard" spherical roller bearings; but, because of changes in internal geometry, it does provide substantial axial play of one race ring relative to the other. The expansion allowance in this type SPHERE-ROL® bearing is normally as much as the end play or expansion allowance that would be found in a non-locating cylindrical roller bearing.

The "E" type SPHERE-ROL® bearing is available with the same sealing advantages, diametral clearance values, tapered bore and outer ring relubrication features as standard bearings shown on page D-25. The basic dynamic rating of "E" type SPHERE-ROL® bearings is 10% less than standard SPHERE-ROL® bearings. Maximum seal misalignment is limited due to increased axial play in bearing.

The expansion-type SPHERE-ROL® bearing will not operate satisfactorily if subjected to thrust loading. Therefore, the expansion-type SPHERE-ROL® bearing must not be used in "fixed" ("held") positions—it is for use only in "expansion" ("float") positions. It is recommended that the end-wise restraint of both race rings of the expansion-type bearing be provided, so that the expansion allowance intended to be available is not lost by error in installation.

Expansion-type SPHERE-ROL® bearings are not normally available from stock. Consult Customer Service for availability.

## Spherical Engineering Section continued

### Lubrication - SPHERE-ROL® Bearings

SPHERE-ROL® bearings as supplied are factory lubricated as follows. Consult Application Engineering regarding grease compatibility issues.

Sphere-Rol Bearings

Lubricant	Bearing Type	Lubricant Temp. Limits (1)
NYLAPLATE® (-S, -SS) LAMBDA® (-YS, -YSS)	NLGI #2 EP grease, polyurea thickened	-30° to +300°F (-34° to 149°C)
High Temp. NYLAPLATE® (-TS, -TSS)	NLGI #2 high temp. grease, inorganic thickener	0° to +400°F (-18° to 204°C)
Unsealed	None, bearing coated with corrosion preventive oil	--

(1) Temperature limits are provided as a capability of the grease lubricant only.

Satisfactory bearing performance at these temperature limits can be dependent on proper lubrication maintenance, internal clearance, bearing materials and installation. Consult Application Engineering for recommendations.

### Lubrication Maintenance

For most applications, due to speed, contamination or temperature conditions, some lubrication interval will be required for sealed SPHERE-ROL® bearings. As such, the sealed SPHERE-ROL® bearing can not typically be applied as a maintenance-free bearing. The “-W33” lubrication groove and holes in the outer ring outside diameter provides a means to add fresh grease or oil as applicable to the bearing through the housing. NYLAPLATE® seals have a venting feature which allows excess or old grease to purge from the bearing.

Frequency of lubrication depends primarily upon the speed of rotation of the bearing, the type of lubrication employed, the amount of contamination present and the relationship of thrust to radial loading. For continuously rotating applications, it is necessary to either provide continuous oil lubrication or else periodic grease lubrication, depending upon the severity of service. Automatic lubrication devices are ideal for intermittent lubrication, since accurate metering of grease and consistent relubrication is maintained through the use of these devices.

Best determination of relubrication interval can be made by testing or experience in the application. Contact Application Engineering for assistance in determining relubrication interval.

# Spherical Engineering Section continued

## Mounting Details - Spherical Roller Bearings Cylindrical Bore

Proper mounting of SPHERE-ROL® spherical roller bearings generally requires a press fit of the ring rotating relative to the radial load. A close to loose fit is used for the ring stationary relative to the radial load. Specific shaft and housing fit selection and respective diameters are listed in the tables below and following pages. The following are some general guidelines and details to bear in mind when installing this bearing series.

### 1. Inspect housing and shaft.

- Clean, remove burrs and sharp edges.
- If any damage has occurred to the bearing seat in the housing or on the shaft, repair that damage to bring the seat surface back to its original condition.
- Ground shaft finishes are normally suggested. Consult Application Engineering if machined finish is to be used.
- When stationary outer rings are required to float (move axially in the housing bore to compensate for expansion), a housing bore surface finish of 65 microinches Ra is recommended.

### 2. Determine which member, shaft or housing has an interference fit with the bearing.

- In general, the ring rotating relative to the radial load has an interference fit.
- Refer to Shaft and Housing seat fit tables for respective fits and tolerances. For applications not covered by these tables, consult Application Engineering for recommendations.

### 3. Install the bearing onto the press-fitted member by applying force against the bearing ring that is press-fitted.

- For a press-fitted inner ring, apply the force required to assemble the bearing onto the shaft against the face of the bearing inner ring.
- For a press-fitted outer ring, apply the force required to assemble the bearing into the housing against the face of the bearing outer ring.
- Care should be exercised to assure that the bearing starts onto the press-fitted member as squarely as possible.
- Use arbor press whenever possible.
- Do not hammer on bearing ring face.

### 4. Inner rings press-fitted on the shaft may be more easily installed by heating the ring and causing it to shrink fit.

- Normally, heating the ring to 175°F to 212°F (79°C to 100°C) will be sufficient to allow the ring to slide over the interference fit shaft seat.
- Heating the ring should be accomplished with an induction heater or in a mineral oil bath. Never use a torch to heat a bearing for assembly purposes.
- Sealed bearings should not be heated in oil bath as the grease with which the bearings are filled may be affected.

## Spherical Engineering Section continued

### 5. When outer rings are to be press-fitted into a housing, it is desirable to heat the housing to allow it to shrink fit onto the outer ring outside diameter.

- Freezing the bearing to shrink it for easy assembly into a press-fitted housing is not recommended. Water condensation can form inside the bearing upon its return to room temperature, which can lead to corrosion. Exposure to extreme cold can also affect the metallurgical structure of the bearing.

### 6. Proper caution should be exercised during installation to guard against axial preload of the bearing. This can be checked by:

- Endplay - Check for endwise "shake" which when present shows that the bearings as installed have endplay.
- Ease of Rotation - Rotate assembly by hand. The bearing must be free from unusual drag or noises.

CAUTION - During installation, do not misalign NYLAPLATE® sealed bearing more than 3° and LAMBDA® sealed bearings more than 1° or seal(s) may be damaged.

## Mounting Details - Spherical Roller Bearings Tapered Bore

SPHERE-ROL® bearings are available with tapered bore feature for applications utilizing tapered adapter sleeve mounting arrangements or tapered shaft seats. This feature sometimes facilitates the mounting of SPHERE-ROL® bearings and can be used to prevent the necessity for heating of bearings or to eliminate the need for complicated press fitting practices.

Standard tapered adapter sleeves, as well as associated lock nuts and lock washers, are tabulated on pages D-11 to D-18 and are identifiable with the appropriate bearing by the suffix number. The separate items may be called out individually by their part number or the complete tapered bore bearing and associated hardware may be identified by the suffix letter "A" following the bearing number. The standard bore taper of these bearings is 1" in 12", on the diameter, and tapered bore bearings are themselves identified by the suffix letter "K" following the basic bearing number.

In mounting, the bearing bore is forced against the taper of the split adapter sleeve or the tapered shaft seat by the action of a lock nut. A progressively tighter fit can be obtained by tightening the lock nut to increase the axial displacement of the bearing along the taper. Due to the need for greater take-up of internal clearance with this type of mounting, special internal clearances are provided. Care must be exercised to insure that the optimum take-up of internal clearance is followed. Too great a reduction of internal clearance will result in potential overheating of the bearing in many applications.

The mounting procedure for adapter mounted, tapered bore SPHERE-ROL® bearings does not require the use of feeler gauge or special gauging procedure. The basic principle of this measurement system is the use of the lock nut and lock washer as a protractor device. Because the lock nuts available for each basic bearing size are standard items, they are manufactured to specific thread pitches. Thus, the axial advancement for each revolution of the nut is predetermined, and the portions of revolutions of the lock nuts required to obtain the correct internal clearance reduction is also predetermined. Additionally, the standard lock washers have a specific number of tangs for each size, and these tangs can be used as the protractor for determining the correct portions of revolutions of the lock nuts. The basic procedure is as follows:

## Spherical Engineering Section continued

1. To reduce friction and facilitate mounting, apply a medium weight oil to the bearing bore, the outside diameter of the adapter sleeve, all threads and the face of the lock nut.

2. Mount the bearing on the tapered seat with a snug fit between the adapter bore and the shaft seat, with the lock nut and lock washer mounted snugly against the face of the bearing inner ring. (A snug fit is obtained when the adapter sleeve no longer rotates when the lock nut is tightened.) At this point, no internal clearance has been removed from the bearing and any advancement of the lock nut will result in reduction of internal clearance due to interference between the bearing bore and tapered seat.

3. Mark a lock washer tang in any suitable manner, and the adjacent, mating area of the lock nut.
4. Count in the direction of tightening, a certain number of tangs, specified at the right.
5. Mark the specified lock washer tang.

## Spherical Engineering Section continued

6. Tighten the lock nut until the marked area on the lock nut is in line with the prescribed lock washer tang. (Lightly striking the face of the lock nut with a soft steel bar will reduce thread pressure and make tightening easier.)
7. If, at this point, none of the tangs line up directly with a corresponding slot in the lock nut OD, rotate the lock nut, in a tightening direction, the additional small amount required to line up the closest slot and tang.
8. The correct internal clearance has now been obtained and the lock washer tang can be peened into the slot of the lock nut, thereby locking the assembly.

The more common procedure used for determining the proper fit of spherical roller bearings on tapered seat is to measure the reduction of internal clearance of the bearing, upon mounting, through the use of feeler gauges or shim stock. This procedure can be utilized with the non-sealed SPHERE-ROL® bearing, if desired. The customer must initially measure and verify the clearance existing in the unmounted bearing, then press the bearing on the tapered seat until the specified amount of clearance has been removed, checking with the feeler gauges. The chart below gives the required diametral clearance reductions which should be used when the feeler gauging procedure is utilized.

### Clearance reduction — (-K suffix)

Bearing Bore In Millimeters	Diametrical Clearance Reduction Inches	Lock Nut Turns Degrees	ABMA Lock Washer Number	Req'd No. of Lock Washer Tangs for Clearance Reduction

## Rollway Radial Roller Bearings

Rollway Radial bearings utilize crowned cylindrical rollers for more dynamic capacity and longer life than comparable ball bearings. These bearings also feature through hardened bearing quality steel raceways and a variety of retainer (cage) options depending on the load/speed requirements of the application (Rollway radial roller bearings are available with standard clearance, as well as clearance ranges greater and less than standard, in order to accommodate application requirements). Depending on your preference, these bearings are available in a wide variety of sizes and options as illustrated on the pages to follow.

# Rollway Radial Roller Nomenclature

## TRU-ROL Numbering

### Prefix

Inner Race Description

### Size Designator

Available Series

### Suffix

Outer Race Description

### Variation Code

Variation Codes Are Divided Into Two Categories; Special And Standard.

**E 1212 U 199**

### Prefix

**E** - Inner Race Separable Both Directions.

**L** - Inner Race Separable One Direction.

**LP** - Two-Piece Inner Race, One Part Is Separable One Direction, The Other Is A Thrust Plate To Form A Channeled Race Assembly.

**U** - Inner Race With Two Flanges, Non-Separable.

**UM** - Inner Race With Two Flanges, Non-Separable, Full Complement Of Rollers.

**None** - No Inner Race Supplied.

Separable.

### Variation Codes

#### Special variation codes

**101 to 129** - are numerically assigned codes that designate the variation from standard (example 101 = 1st variation, 102 = 2nd variation, etc.). These bearing code numbers do not in any way reference the modification from standard. Application Engineering must be contacted for information concerning a particular modification.

### Size Designator

Available Series; 1000, 1200, 1300, 5200, 5300 And 6200.

#### Standard variation codes

**001 to 099 and 130 to 199** - are code numbers representing standard modifications. The most popular are listed below:

### Suffix

**E (EMR)** - Outer Race Separable Both Directions.

**L (LMR)** - Outer Race Separable One Direction.

**LP (LPMR)** - Two-Piece Outer Race, One Part Is Separable One Direction, The Other A Thrust Plate To Form A Channeled Race Assembly.

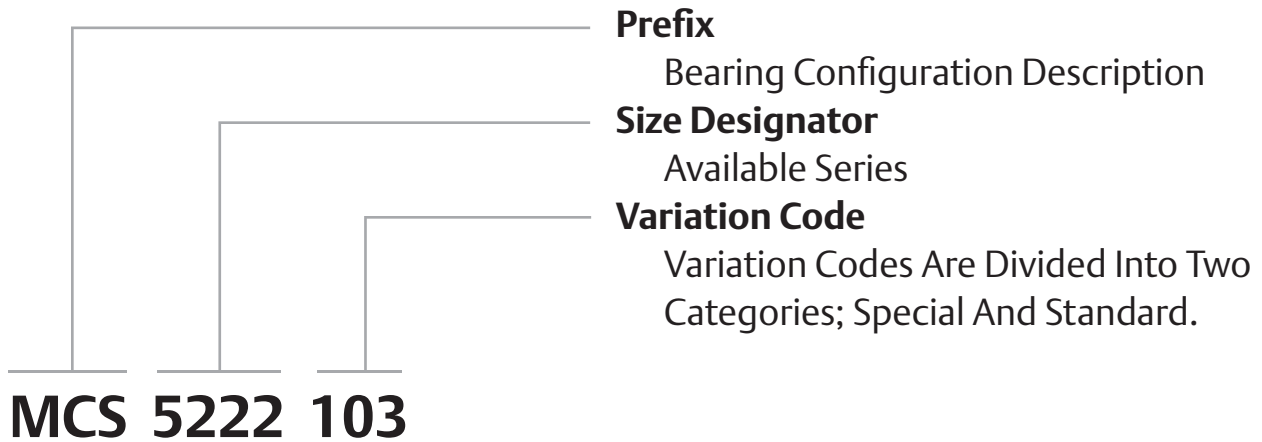

**U (UMR)** - Outer Race With Two Flanges, Non Separable.

**B** - Outer Race With Two Snap Rings To Retain The Roller Set, Non-Separable.

**J** - Outer Race With One Snap Ring And One Flange To Retain The Roller Set, Non

- **K** - Over sized OD.
- **003** - Rollway internal clearance Class 3.
- **005** - Rollway internal clearance Class 5.
- **007** - Rollway internal clearance Class 7.
- **019** - Outer race with SAE ring groove around OD.
- **027** - Outer race with blind hole or locating slot in outer race.
- **191** - Broached retainer.
- **199** - Bearing with SAE ring groove on OD and snap ring furnished.

## Rollway Radial Roller Nomenclature MAX Numbering

### Prefix

**ML** - Bearing assembly with roller assembly retained in inner race, outer race separable one direction.

**MCS** - Bearing assembly with roller assembly retained in inner race, outer race separable both directions.

**MN** - Bearing assembly with roller assembly retained in inner race. Two-piece outer race, one part is separable one direction, the other is a thrust plate to form a channel race.

**MS** - Bearing assembly with roller assembly retained in inner race. Outer race with two snap rings to retain the roller set, non-separable.

**M** - Bearing assembly with roller assembly retained in inner race. Outer race with two snap rings to retain the roller set, non-separable with a full complement of rollers.

**MUC** - Bearing assembly with inner race separable both directions. Roller assembly retained in outer race.

**MUL** - Bearing assembly with inner race separable one direction. Roller assembly retained in outer race.

**MU** - Bearing with a two-piece inner race, one part is separable one direction, the other is a thrust plate to form a channeled race. Outer race retains the roller assembly.

**MR** - Bearing with a two-piece inner race, one part is separable one direction, the other is an HJ ring to form a channel race. Outer race retains the roller assembly.

### Size Designator

Available series; 100, 200, 300, 5000 and 5100.

### Variation Codes

#### Special variation codes

**101 to 199** - are numerically assigned codes that designate the numerical variation from standard (example 101 = 1st variation, 102 = 2nd variation, etc.). These bearing code numbers do not in any way reference the modification from standard. Application Engineering must be contacted for information concerning a particular modification.

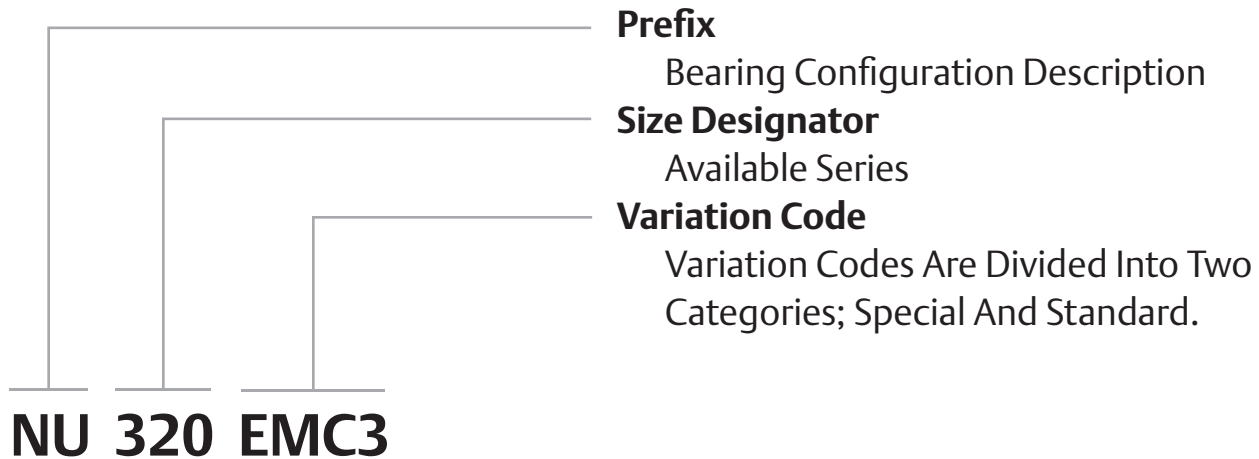

#### Standard variation codes

**001 to 099** - are code numbers representing standard modifications. The most popular are listed below:

- **003** - Rollway internal clearance Class 3.
- **005** - Rollway internal clearance Class 5.
- **007** - Rollway internal clearance Class 7.

# Rollway Radial Roller Nomenclature ISO Numbering

## Prefix

**NU** - Bearing assembly with inner race separable both directions. Roller assembly retained in outer race.

**NUP** - Bearing with a two piece inner race, one part is separable one direction, the other is a thrust plate to form a channeled race. Outer race retains the roller assembly.

**NJ** - Bearing assembly with inner race separable one direction. Roller assembly retained in outer race.

**N** - Bearing assembly with roller assembly retained in inner race. Outer race separable both directions.

## Standard variation codes

Are code numbers representing standard modifications. The most popular are listed below:

- **E** - Extra capacity design
- **M** - Machined brass retainer
- **C2** - ABMA internal clearance symbol 2
- **C3** - ABMA internal clearance symbol 3
- **C4** - ABMA internal clearance symbol 4
- **S1** - Bearing is stabilized for operation at 390°F

## Size Designator

Available series; 200, 300, 2200 and 2300.

## Variation Codes

### Special variation codes

**VAA** - begins an alpha code assigned to designate the variation from standard (example VAA = 1st variation, VAB = 2nd variation, etc.). These bearing codes do not in any way reference the modification from standard. Application Engineering must be contacted for information concerning a particular modification.

## Features and Benefits

### Unmounted Internal Clearances

Rollway's standard is C3, though other unmounted internal clearances are readily available.

### Retainers

Standard retainer options include segmented steel or machined brass, which are detailed on the following pages.

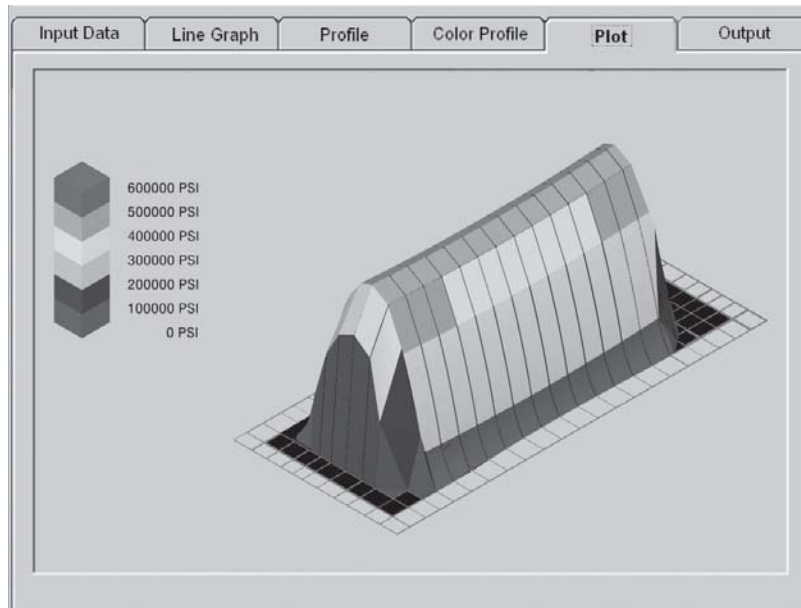

### Precision Ground Inner and Outer Races

Races are manufactured from through hardened bearing grade steel. Surfaces are precision ground to RBEC 1 and stabilized to 335°F.

# Features and Benefits

## Matched Precision Crowned Rollers

All radial rollers are crowned. Extra capacity bearing designs have larger rollers, maximizing the load carrying potential of the bearing's cross sectional area. Crowned rollers yield a more evenly distributed load pattern on the races, resulting in longer life. All Rollway cylindrical and tapered bearings feature crowned rollers.

## Options

### Stamped Steel Retainer

A one-piece, steel stamping. Supplied on some bearings with snap ring retention. (TRU-ROL numbering suffix of "R") Recommended for low speed operations.

- Stamped Steel
- Rides below pitch circle
- Low Speed
- Used only with Outer Race or Retaining rings
- Rollers guided by raceway flanges
- Well suited for volume production
- Inexpensive in comparison to other retainers

### Segmented Steel Retainer

A built-up type of retainer utilizing steel segments rigidly held between stamped, steel end plates. This is the standard retainer supplied with commercial bearings identified with the TRU-ROL numbering system. Recommended for moderate speed applications.

- Formed steel segments held between two steel end plates
- Good roller guidance with minimizing friction
- Flexible – accommodates different widths
- This retainer design is well adapted for volume production

### Two-Piece Retainer

This type of retainer is fabricated from brass. This is the standard retainer supplied with Rollway bearings identified with the MAX numbering system, ISO numbering system, TRU-ROL numbering system when the "MR" suffix is used, and any bearing with bore size over 180mm. Recommended for moderate to high speed applications.

- Accurate roller guidance
- Machined Pockets to minimize skewing
- Typically made of brass, cast iron is available for applications where brass cannot be used
- Higher speed applications
- Recommended when torsional loading on retainer is severe.
- Available with most radial roller

## Options continued

### One-Piece Retainer

This land piloting retainer is fabricated from brass or steel with radial retention of the rollers provided by closing the roller “pocket” with small projections formed by mechanically upsetting the retainer material. This retainer design is typically made to order for high speed applications, though it is applicable for other applications. It should be noted that retainers may be designed for specific applications to enhance bearing performance. Please contact Application Engineering for more information.

- High speed applications
- Made of brass or silver plated steel
- Land riding, minimizing friction between the rollers and the retainer
- Special order only

### Race and Roller Material

The races and rollers in standard Rollway bearings are made of high alloy, through-hardened and/or case carburized steels that are stabilized for operation up to 250°F for case carburized steel and 335°F for through-hardened steels. For operating temperatures in excess of 335°F, special materials and/or stabilization procedures are necessary.

Vacuum-degassed steels are used in standard bearings; however, consumable-electrode remelted steels (from either air CEVM or vacuum-melted electrodes VIMVAR) are available in all alloys and will be supplied upon request.

We also manufacture low quantities of bearing designs with M-50 tool steel for applications requiring high temperature hardness and average operating temperatures over 400°F but less than 800°F.

# ROLLWAY® Radial Bearings

- Basic Construction Type:** Cylindrical Roller Bearing
- Rolling Elements:** Crowned Cylindrical Rollers
- Bearing Material:** Through Hardened Bearing Grade Steel
- Retainer Type:** Stamped Steel, Segmented Steel, Two Piece Brass, One Piece Land Riding Brass

Radial Roller bearings and manufactured to the ABMA RBEC-1 tolerance class. Bearing manufactured to either RBEC-3, RBEC-5 or special tolerance classes are also available upon request.

Unless otherwise specified all Rollway radial roller bearings are manufactured to ABMA's RBEC-1 precision class.

\*rs and rh are the maximum shaft and housing fillet radius that can be cleared.

Metric dimensions for reference only.

Not all parts are available from stock. Please contact customer service for availability (800) 626-2120.

For more information on bearing capabilities outside of our standard offering, please contact Application Engineering (800) 626-2093.

Radial Roller bearings and manufactured to the ABMA RBEC-1 tolerance class. Bearing manufactured to either RBEC-3, RBEC-5 or special tolerance classes are also available upon request.

Unless otherwise specified all Rollway radial roller bearings are manufactured to ABMA's RBEC-1 precision class.

\*r<sub>s</sub> and r<sub>h</sub> are the maximum shaft and housing fillet radius that can be cleared.

Metric dimensions for reference only.

Not all parts are available from stock. Please contact customer service for availability (800) 626-2120.

For more information on bearing capabilities outside of our standard offering, please contact Application Engineering (800) 626-2093.

Radial Roller bearings and manufactured to the ABMA RBEC-1 tolerance class. Bearing manufactured to either RBEC-3, RBEC-5 or special tolerance classes are also available upon request.

Unless otherwise specified all Rollway radial roller bearings are manufactured to ABMA's RBEC-1 precision class.

\*rs and rh are the maximum shaft and housing fillet radius that can be cleared.

Metric dimensions for reference only.

Not all parts are available from stock. Please contact customer service for availability (800) 626-2120.

For more information on bearing capabilities outside of our standard offering, please contact Application Engineering (800) 626-2093.

Radial Roller bearings and manufactured to the ABMA RBEC-1 tolerance class. Bearing manufactured to either RBEC-3, RBEC-5 or special tolerance classes are also available upon request.

Unless otherwise specified all Rollway radial roller bearings are manufactured to ABMA's RBEC-1 precision class.

\*rs and rh are the maximum shaft and housing fillet radius that can be cleared.

Metric dimensions for reference only.

Not all parts are available from stock. Please contact customer service for availability (800) 626-2120.

For more information on bearing capabilities outside of our standard offering, please contact Application Engineering (800) 626-2093.

Radial Roller bearings and manufactured to the ABMA RBEC-1 tolerance class. Bearing manufactured to either RBEC-3, RBEC-5 or special tolerance classes are also available upon request.

Unless otherwise specified all Rollway radial roller bearings are manufactured to ABMA's RBEC-1 precision class.

\*rs and rh are the maximum shaft and housing fillet radius that can be cleared.

Metric dimensions for reference only.

Not all parts are available from stock. Please contact customer service for availability (800) 626-2120.

For more information on bearing capabilities outside of our standard offering, please contact Application Engineering (800) 626-2093.

Radial Roller bearings and manufactured to the ABMA RBEC-1 tolerance class. Bearing manufactured to either RBEC-3, RBEC-5 or special tolerance classes are also available upon request.

Unless otherwise specified all Rollway radial roller bearings are manufactured to ABMA's RBEC-1 precision class.

\*rs and rh are the maximum shaft and housing fillet radius that can be cleared.

Metric dimensions for reference only.

Not all parts are available from stock. Please contact customer service for availability (800) 626-2120.

For more information on bearing capabilities outside of our standard offering, please contact Application Engineering (800) 626-2093.

## Load Ratings and Life

### Life Calculations

The L10 (rating) life for any given application and bearing selection can be calculated in terms of millions of revolutions by using the bearing Basic Dynamic Rating and applied radial load (or, equivalent radial load in the case of radial bearing applications having combined radial and thrust loads). The L10 life for any given application can be calculated in terms of hours, using the bearing Basic Dynamic Rating, applied load (or equivalent radial load) and suitable speed factors, by the following equation:

$$L_{10} = \left(\frac{C}{P}\right)^{10/3} \times \frac{1,000,000}{60 \times n} = \left(\frac{C}{P}\right)^{10/3} \times \frac{16667}{n}$$

Where:

$L_{10}$  = The # of hours that 90% of identical bearings under ideal conditions will operate at a specific speed and condition before fatigue is expected to occur.

C = Basic Dynamic Rating (lbs)  
1,000,000 Revolutions

P = Constant Equivalent Radial Load (lbs)

n = Speed (RPM)

Additionally, the ABMA provides application factors for all types of bearings which need to be considered to determine an adjusted Rated Life ( $L_{na}$ ). L10 life rating is based on laboratory conditions yet other factors are encountered in actual bearing application that will reduce bearing life.  $L_{na}$  life rating takes into account reliability factors, material type, and operating conditions.

$$L_{na} = a_1 \times a_2 \times a_3 \times L_{10}$$

Where:

$L_{na}$  = Adjusted Rated Life.

$a_1$  = Reliability Factor. Adjustment factor applied where estimated fatigue life is based on reliability other than 90% (See Table No 1).

Table No. 1 Life Adjustment Factor for Reliability

Reliability %	$L_{na}$	$a_1$
90	L10	1
95	L5	0.62
96	L4	0.53
97	L3	0.44
98	L2	0.33
99	L1	0.21
50	L50	5

$a_2$  = Material Factor. Life adjustment for bearing race material. Regal Power Transmission Solutions bearing races are manufactured from bearing quality steel. Therefore the  $a_2$  factor is 1.0.

$a_3$  = Life Adjustment Factor for Operating Conditions. This factor should take into account the adequacy of lubricant, presence of foreign matter, conditions causing changes in material properties, and unusual loading or mounting conditions. Assuming a properly selected and mounted bearing having adequate seals and lubricant operating below 250°F and tight fitted to the shaft, the  $a_3$  factor should be 1.0.

# Load Ratings and Life Continued

Vibration and shock loading can act as an additional loading to the steady expected applied load. When shock or vibration is present, an a3 Life Adjustment Factor can be applied. Shock loading has many variables which often are not easily determined. Typically, it is best to rely on one’s experience with the particular application. Consult Application Engineering for assistance with applications involving shock or vibration loading.

The a3 factor takes into account a wide range of application and mounting conditions as well as bearing features and design. Accurate determination of this factor is normally achieved through testing and in-field experience. Regal Power Transmission Solutions offers a wide range of options which can maximize bearing performance. Consult Application Engineering for more information.

## Operating Conditions Factor

The life of a bearing is dependent on the operating conditions of the application. Lubrication, effects of the external environment, shaft and housing geometry and mounting, all have an affect on the actual bearing life. To determine a more realistic life calculation, the Operating Conditions Factor (F) can be included into the L<sub>10</sub> life equation. The actual values determination will be based on experience of the designer and the expected operating conditions.

Using the Operating Conditions Factor (F) in the life equation, L<sub>10</sub> life in hours now becomes:

$$L_{10} = F \times \left[ \left( \frac{C}{P} \right)^{3.33} \times \frac{16667}{n} \right]$$

Proper selection of the F factor demands intimate knowledge of the application. Where little is known of the application, it is recommended that F = 1 be selected. As a guide in selecting a realistic value for F, Rollway suggests use of the following, cumulative, individual sub-factors, f, to arrive at the over-all factor, F, thus:

$$F = f_1 \times f_2 \times f_3 \times f_4 \dots$$

The table below defines the application parameters and values recommended for derivation of the individual sub-factors.

**Radial Bearing Factors**

Factor	Application Condition	Factor Estimates	
		Poor	Excellent
f <sub>1</sub>	Lubricant viscosity suitability @ bearing operating temperature (see Lubrication)	.5	1.0
f <sub>2</sub>	External environment and provisions for isolation	.5	1.0
f <sub>3</sub>	Operational conditions of shaft and housing squareness & rigidity	.5	1.0
f <sub>4</sub>	Machine usage; conventional rotating machinery = 1.0 reciprocating machinery = .55 impact-inducing machinery = .25	.25	1.0
f <sub>5</sub>	Thrust load accompanying radial load; below permissible thrust load = 1.0 at or near permissible thrust load = .8 exceeding permissible thrust load by 25% = .5	.5	1.0

**Thrust Bearing Factors**

Factor	Application Condition	Factor Estimates	
		Poor	Excellent
f <sub>1</sub>	Lubricant viscosity suitability @ bearing operating temperature (see Lubrication)	.5	1.0
f <sub>2</sub>	External environment and provisions for isolation	.5	1.0
f <sub>3</sub>	Operational conditions of shaft and housing squareness & rigidity	.5	1.0
f <sub>4</sub>	Bearing thrust plate backing system full backing vs partial backing	.5	1.0

## Load Ratings and Life Continued

### Variable Load Formula

Root mean load (RML) is to be used when a number of varying loads are applied to a bearing for varying time limits. Maximum loading still must be considered for bearing size selection.

$$RML^* = \sqrt[10/3]{\frac{(L_1^{10/3} N_1) + (L_2^{10/3} N_2) + (L_3^{10/3} N_3)}{100}}$$

Where:

RML = Root Mean Load (lbs.)

L<sub>1</sub>, L<sub>2</sub>, etc. = Load in pounds

N<sub>1</sub>, N<sub>2</sub>, etc. = Percent of total time operated at loads L<sub>1</sub>, L<sub>2</sub>, etc.

\* Apply RML to rating at mean speed to determine resultant life.

### Mean Speed Formula

The following formula is to be used when operating speed varies over time.

$$\text{Mean Speed} = \frac{S_1 N_1 + S_2 N_2 + S_3 N_3}{100}$$

S<sub>1</sub>, S<sub>2</sub>, etc = Speeds in RPM

N<sub>1</sub>, N<sub>2</sub>, etc = Percentage of total time operated at speeds S<sub>1</sub>, S<sub>2</sub>, etc

### Bearing Life In Oscillating Applications

The equivalent rotative speed (ERS) is used in life calculations when the bearing does not make complete revolutions during operation. The ERS is then used as the bearing operating speed in the calculation of the L10 (Rating) Life. The formula is based on sufficient angular rotation to have roller paths overlap.

ERS = Equivalent Rotative Speed

N = Total number of degrees per minute through which the bearing will rotate.

$$ERS = \frac{N}{360}$$

In the above formula, allowance is made for the total number of stress applications on the weakest race per unit time, which, in turn, determines fatigue life and the speed factors. The theory behind fretting corrosion is best explained by the fact that the rolling elements in small angles of oscillation retrace a path over an unchanging area of the inner or outer races where the lubricant is prevented by inertia from flowing in behind the roller as the bearing oscillates in one direction. Upon reversal, this small area of rolling contact is traversed by the same roller in the dry state. The friction of the two unlubricated surfaces causes fretting corrosion and produces failures which are unpredictable from a normal life standpoint.

# Load Ratings and Life Continued

With a given bearing selected for an oscillating application, the best lubrication means is a light mineral oil under positive flow conditions. With a light oil, there is a tendency for all areas in the bearing load zone to be immersed in lubricant at all times. The full flow lubrication dictates that any oxidized material which may form is immediately carried away by the lubricant, and since these oxides are abrasive, further wear tends to be avoided. If grease lubrication must be used, it is best to consult with either the bearing manufacturer or the lubricant manufacturer to determine the best possible type of lubricant. Greases have been compounded to resist the detrimental effect of fretting corrosion for such applications.

## Static Load Rating

The “static load rating” for rolling element bearings is that uniformly distributed static radial load acting on a non-rotating bearing, which produces a contact stress of 580,000 psi (roller bearings) or 607,000 psi (ball bearings) at the center of the most heavily loaded rolling element. At this stress level, plastic deformation begins to be significant. Experience has shown that the plastic deformation at this stress level can be tolerated in most bearing applications without impairment of subsequent bearing operation. In certain applications where subsequent rotation of the bearing is slow and where smoothness and friction requirements are not too exacting, a higher static load limit can be tolerated. Where extreme smoothness is required or friction requirements are critical, a lower static load limit may be necessary.

## Minimum Bearing Load

Skidding, or sliding, of the rolling elements on the raceway instead of a true rolling motion can cause excessive wear. Applications with high speeds and light loading are particularly prone to skidding. As a general guideline, rolling element bearings should be radially loaded at least 2% of Basic Dynamic Rating. For applications where load is light relative to the bearings dynamic load rating, consult Application Engineering for assistance.

## High Steady Loads and Shock Loads

Bearing basic dynamic capacity and basic static capacity are determined through a consideration of entirely different factors. The prime consideration for dynamic capacity is the magnitude of the stressed volume of metal and the probability that it will endure a given number of loading cycles. For static capacity, the prime consideration is the influence of the elastic limit and rupture limit as manifested by the extent of the permanent deformations that occur. In view of the seemingly great difference in bases for consideration of dynamic and static capacities, it might be concluded that they bear no relation to one another. Such is not always the case when considering very high steady loads or shock loads present in a rotating bearing. The extent to which these loads approach (or exceed) the basic static capacity will determine the validity of the use of the life formula. More explicitly, when the following relationship exists, ordinary means may be used in determining bearing life.

$$\frac{C_0}{f_s P_0} \geq \left( \frac{C/P}{33 \ 1/3} \right)^{0.30}$$

- Where:  $C_0$  = Bearing basic static capacity-lbs  
 $P_0$  = Value of the radial load or maximum shock load-lbs  
 $f_s$  = Safety factor for high radial or shock loads (dependent on duration of peak load and type of bearing service demanded throughout life of bearing in given application)  
 $f_s = 0.5$  for occasional high steady load but no shock  
 $f_s = 1.0$  for continuous high steady load but no shock  
 $f_s = 2.0$  for maximum shock loads and/or where very smooth subsequent bearing operation is required  
 $C, P$  = As previously defined  
 $n$  = Rotational speed - rpm

A warning note on use of the above relation: even when the solution indicates that conventional means may be used in estimating bearing life, such a fatigue life forecast becomes invalid where less-than-optimum lubrication permits shock loads to induce fretting wear (false brinelling).

## Radial Engineering Section

Rollway cylindrical radial roller bearings are available in a vast variety of sizes and configurations ranging from standard cataloged, 45mm ID bearings to 1,016 mm outside diameter, special engineered bearings.

The ABMA has established standard design criteria for radial roller bearings. It has defined standard series for the roller bearings by identifying the outside diameter and width for a given bore diameter. The illustration below demonstrates the differences in cross section for the given series.

### Rollway Series Codes

The races and rollers in standard Rollway bearings are made of vacuum-degassed, high alloy, through-hardened and/or case carburized steels that are stabilized for operation up to 250°F for case carburized steel and 335°F for through-hardened steels. For operating temperatures in excess of 335°F, special materials and/or stabilization procedures are necessary.

All Rollway bearings are made with crowned rollers, which satisfy the general requirements for modified-line contact, in accordance with ABMA definitions. The Rollway crowning technique is a highly developed technology including analytical, experimental, processing and quality control techniques to ensure the following:

1. A minimization of end effects and stress concentrations under design load conditions.
2. Detailed understanding and the necessary controls for demanding applications where reliability and higher theoretical capacities are essential.

Vacuum-degassed steels are used in standard bearings; however, consumable-electrode remelted steels (from either air CEVM or vacuum-melted electrodes VIMVAR) are available in all alloys and will be supplied upon request. We also manufacture low quantities of bearing designs with M-50 tool steel for applications requiring high temperature hardness and average operating temperatures over 400°F but less than 800°F.

### Designs

Rollway cylindrical radial roller bearings are available in a vast variety of sizes and configurations. The different bearing configurations are described on page E-5 and listed in the bearing product table starting on page E-15. Over the years, the Rollway product offering has increased. Each new product line has its own numbering system, resulting in the current offering of multiple nomenclatures. The three basic numbering systems are Tru-Rol, MAX, and ISO. These three nomenclature systems are defined on the following charts:

Rollway cylindrical radial roller bearings are available in a vast variety of sizes and configurations ranging from standard cataloged, 45mm ID bearings to 1,016 mm outside diameter, special engineered bearings. This section of the catalog covers Rollway cylindrical radial roller bearing configurations, part numbering, material, retainer design and limiting speeds.

### Configuration and Numbering System Inner Race Separable, Both Directions

Number Systems

E-####-U

E-####-B

MUC-####

NU-###

Two-flange (or retaining rings) outer race, straight inner race, separable bearing. For applications where axial float in both directions is desired. Roller assembly remains with the outer race.

### Inner Race Separable, One Direction

Number Systems

L-####-U

MUL-####

NJ-###

Two-flange outer race, one-flange inner race, separable bearing. For applications where axial float in one direction and axial retention in the other direction is desired. Roller assembly remains with the outer race. Will carry light thrust loads in one axial direction.

### Two Piece Inner Race, Four-Flange Design

Number Systems

LP-####-U

MU-####

NUP-###

Two-flange outer race, two-flange inner race with one flange plate, separable bearing. For applications where axial retention in both directions is desired. Roller assembly remains with the outer race. Will carry light thrust loads in both axial directions.

### Outer Race Separable Both Directions

Number Systems

U-####-E

MCS-####

N-###

Straight outer race, two-flange inner race, separable bearing. For applications where axial float is desired. Roller assembly remains with the inner race.

## Radial Engineering Section continued

### Outer Race Separable One Direction

Number Systems

U-####-L

ML-####

One-flange outer race, two-flange inner race, separable bearing. For applications where axial float in one direction and axial retention in the other directions is desired. Roller assembly remains with the inner race.

Will carry light thrust loads in one direction.

### Two-Piece Outer Race Four-Flange Design

Number Systems

U-####-LP

MN-####

Two-flange outer race with one flange plate, two-flange inner race, separable bearing. For applications where axial retention in both directions is desired.

Roller assembly remains with the inner race. Will carry light thrust loads in both axial directions.

### Non-Separable

Number Systems

U-####-B

MS-####

Or when supplied with a full complement of rollers.

Number Systems

UM-####-B

M-####

Two snap-ring flange outer race, two-flange inner race, non-separable bearing.

No axial retainer of outer race is required when inner race is properly mounted on shaft. Will not carry thrust loads.

### Precision and Tolerance

Standard catalog, radial roller bearings are manufactured to the ABMA RBEC-1 tolerance class. Many applications may require greater precision than standard because of high rotational speeds or other exacting requirements. Bearings manufactured to either RBEC-3, RBEC-5 or special tolerance classes are also available upon request.”

### Internal Clearance

Unmounted internal radial clearance may be determined by two methods:

1. Dimensionally from the geometry of the bearing
2. By an inspection gaging procedure prescribed in the ABMA Standards handbook

Dimensionally, internal radial clearance is equal to the bore of the outer race minus the sum of the inner race OD and two roller diameters. The gaging procedure specifies that one of the bearing races be fixed horizontally on a flat plate. A specified radial load is then applied to the unsupported race, alternately, in diametrically opposing directions. The internal radial clearance is the total displacement of the unsupported race.

The sole reason for manufacturing bearings with differing internal radial clearance is to give the designer a means to achieve predetermined clearance in the mounted revolving bearing. In determining this final running clearance it is necessary to take into consideration, in addition to the effects of shaft, housing interference fits and surface finish, the desire to meet one or more of the following conditions:

1. Optimum load distribution through the rollers to result in maximum life
2. Minimum bearing operating temperature
3. Minimum bearing torque
4. Minimum bearing noise level

The group classification of unmounted radial internal clearance should be specified only after a complete analysis of the resultant clearance of the mounted and operating bearing. The commonly available unmounted internal clearances of Rollway bearings are shown in the following tables. In general, Rollway standard internal clearances for the Tru-Rol and Max numbering systems are equivalent to the ISO C3 clearance.

## Radial Engineering Section continued

The resultant bearing internal radial clearance after mounting and with the bearing in operation will differ from the unmounted clearance due to:

1. The press fit between the shaft and inner race and/or a press fit between the housing and outer race, each resulting in an internal clearance reduction.
2. An increase in the temperature of the inner race over that of the outer race, which will result in a reduction of internal clearance. Conversely, an increase in temperature of the outer race over that of the inner race may result in increased internal clearance.

The formula for the resultant internal clearance of the bearing after mounting and in operation is:

$$S_r = [S_0 - (S_1 \pm S_2 - S_3 \pm S_x)] \geq 0$$

Where:

$S_r$  = Resultant clearance - .0001 in.

$S_0$  = Initial (unmounted) clearance

$S_1$  = Clearance reduction due to interference fits

$S_2$  = Clearance reduction, or increase, due to race temperature differential

$S_3$  = Clearance increase due to load

$S_x$  = Clearance reduction, or increase, due to high rotational speed or any other effects

Determination of terms  $S_1$  through  $S_x$  is described in the following paragraphs.

The clearance reduction due to fit is the sum of the effective inner race expansion,  $a$ , and the effective outer race contraction,  $b$ , under given press fit conditions (shaft and housing fits).

$$S_1 = a + b (.0001")$$

Where  $a$  and  $b$  are as follows:

- a.  $a$  = expansion of the inner race is estimated; (interference fit) X .75
- b.  $b$  = contraction of the outer race is estimated; (interference fit) X .85

And assumes the application has

1. solid shaft
2. rigid housing

In the case of a hollow shaft, and/or flexible housing, Application Engineering should be consulted for resultant fits.

Operating conditions normally will not be so unusual that other clearance effects ( $S_x$ ) must be considered. However, unusual cases do occur. It is suggested that Application Engineering be consulted when conditions may exist which warrant consideration of clearance changes ( $S_x$ ) that are not covered by terms  $S_1$ ,  $S_2$ , and  $S_3$ .

## Radial Engineering Section continued

### Limiting Speed

The limiting speed of a roller bearing is the rotational speed at which it may be operated based on geometry, retainer construction, lubricant and lubrication method without incurring a temperature rise within the bearing which would cause lubricant breakdown, softening of components, or seizure. The criterion used is the  $dn$  value where  $d$  equals the bearing pitch diameter (mm) and  $n$  equals the bearing rotation speed (rpm). The  $dn$  numbers applying to specific retainers are provided in the table below. To calculate the bearing limiting speed, one can divide the  $dn$  number by the bearing pitch diameter in mm to obtain the bearing limiting speed in rpm. This  $dn$  number provides the suggested safe limiting speeds for cylindrical radial roller bearings with various types of retainer construction based on recirculating oil lubrication with a lubricant of adequate viscosity.

### Rollway Limiting Speed Factors

Retainer Type	$dn$ Factor
Full roller complement	240000
Stamped Steel	380000
Segmented Steel	700000
Two-Piece Brass	700000
One-Piece Land Riding	1400000

In the selection of a retainer design for obtaining the highest practical roller bearing operating speed, it is often necessary to consider other factors than speed alone. For example, a two-piece drilled retainer might be selected over a segmented retainer where the torsional loading on the retainer is severe even though the segmented type appears adequate with respect to speed. It should be noted that suggested limiting speeds are provided for the standard roller-riding retainers (segmented, two-piece drilled and window-type stamped steel) and one-piece land riding retainers. Special retainer designs for each of these types permit higher operating speeds and are available upon request.

When using the table above, the following guidelines should be followed:

- For grease lubricant applications, use 80% of the calculated limiting speed.
- For air-oil mist lubricant applications, use 150% of the calculated limiting speed.
- For fixed volume of non-recirculated oil, use 85% of the calculated limiting speed.
- For double width and multi-row designs, use 67% of the calculated limiting speed.

## Radial Engineering Section continued

### Radial Bearing Axial Load Capacity

Cylindrical roller bearings that contain flanges on both the inner and outer rings are able to support axial loads in addition to radial loads. The axial load capability is determined through a consideration of the sliding friction and resultant wear taking place between the roller ends and flange faces. The factors having the greatest effect on this sliding friction are the bearing lubrication, operating temperature, and heat dissipation from the bearing.

Radial dynamic capacity is determined through a consideration of the fatigue strength of the bearing material. Thrust capacity is determined through a consideration of the sliding friction and resultant wear taking place between the roller ends and flange faces. Heat generated by the sliding friction must be effectively dissipated throughout the bearing components and by the lubricant in order to maintain thermal equilibrium at a reasonable temperature. The advantage of the cylindrical roller bearing under combined radial and thrust loads is apparent when it is observed that the radial load and the thrust load are taken by two different surfaces. In view of this, there should be no reduction in expected life, which is determined solely by the existing radial load, when thrust load are taken by the bearing.

Thrust capacity is dependent upon bearing design and application characteristics. Bearing design characteristics include:

- a. Apparent contact area between rollers ends and mating flange surfaces.
- b. Surface finish of the mating surfaces.
- c. Geometry of the mating surfaces.
- d. Internal radial clearance and axial clearance of the roller in the roller track.

Application characteristics are a function of:

- a. Sliding velocity at the contact surfaces (rpm and bearing size)
- b. Quality and quantity of the lubricant and effectiveness of the lubrication system.
- c. Type and duration of thrust loads.
- d. Influence of the shaft and housing in heat dissipation
- e. Operating temperatures.

A radial bearing should not be used in applications where there are essentially large thrust loads with no significant radial loads. In most applications, machine masses are of sufficient magnitude to apply a substantial radial load on the bearing without external radial forces. In these cases there will be sufficient radial load to allow satisfactory operation under substantial thrust loads. As a general rule, Rollway radial bearing thrust capacity is 10% of the published radial bearing dynamic rating.

### Lubrication

In general, the required viscosity for the lubricant on cylindrical radial bearings is 110 SSU at operating temperature. For further information in regards to bearing lubrication, please refer to page A-17 of this catalog.

# *Thrust*

Unmounted bearing assembly consisting of through hardened housing and shaft plate (raceways) with cylindrical or tapered rolling elements separated by a centrifugally cast brass retainer (cage). Thrust bearings are ideal for applications with loads parallel to the shaft.

## Rollway Cylindrical Thrust Bearings

Rollway Cylindrical Thrust bearings utilize crowned cylindrical rolling elements separated by a machined brass roller riding retainer (cage) contained within precision ground shaft and housing plates. These bearings are intended for axial loads (load parallel to the axis of rotation) and are designed as medium or heavy duty series. Either series is available in three configuration types including double acting, self aligning and the most widely used “single acting” variety. Depending on your preference, these bearings are available in a wide variety of sizes and options as illustrated on the pages to follow.

Cylindrical roller thrust Inch series bearings are divided into two basic classes: medium (600 series) and heavy (700 series). The medium series has a smaller cross section and the retainer typically has only one roller per roller pocket. The heavy series has a larger cross section and the retainer typically has more than one roller per roller pocket.

## Type Designator

Bearing Configuration Description

## Size Designator

Reference Catalog For Sizes.

## Variation Code

Variation Codes Are Divided Into Two Categories: Special And Standard.

**T 625 203**

### Type Designator

- T** - Single acting thrust
- AT** - Single acting thrust - aligning type.
- DT** - Double acting thrust
- DAT** - Double acting thrust - aligning type.
- BSDT** - Double acting thrust - simplified design
- CT** - Single acting thrust - special design for crane hook applications with weathershed
- WCT** - Single acting thrust - special design for crane hook applications with weathershed and grease fitting

### Size Designator

Reference catalog for sizes.

### Variation Codes

#### Special variation codes

**201 to 215 and 240 to 254** - are numerically assigned codes that designate the variation from standard (example 201 = 1st variation, 202 = 2nd variation, etc.). These bearing code numbers do not in any way reference the modification from standard. Application Engineering must be contacted for information concerning a particular modification.

### Standard variation codes

**216 to 239 and 255 to 299** - 216 to 239 and 255 to 299 are code numbers representing standard modifications with the most popular listed below:

- **059** - Brass retainer - this code is obsolete, all standard thrust bearings are supplied with centrifugally cast brass retainers
- **210** - Roller assembly supplied with hardened steel outer ring
- **216** - Standard bearing supplied without shaft plate
- **219** - Tandem bearing design (typically these have been replaced with TAB to TAC bearings)
- **221** - Standard bearing with a brass ring pressed in bore for horizontal shaft applications
- **226** - Standard bearing supplied with two shaft plates
- **229** - Same as 219.

## Features and Benefits

### Precision Ground Shaft Plate

Bore is precision ground for a line to loose fit on shaft. The O.D. has a turned finish and is smaller than the housing plate's O.D. Shaft Plates are manufactured to conform to ABMA size and tolerance specifications.

### Matched Precision Ground Rollers

Rollers are manufactured from Through Hardened Bearing Grade Steel. The surfaces are ground, superfinished, and matched to .0001". The ends of the rollers have a large machined radius designed to reduce friction between the roller and the retaining ring. The larger diameter bearings use multiple rollers per pocket to minimize slippage. All rolling elements are precision ground to provide even distribution of load over the contact surfaces. The rollers are all crowned thus permitting unmodified use of the ABMA's capacity formula. Roller crowning reduces the edge stresses between the roller and the thrust plates.

### Machined Brass Roller Riding Retainer

Rollway thrust bearing retainers are machined from centrifugally cast brass. The retainers for all cylindrical roller thrust bearings are designed to be roller riding. The contoured roller pockets are accurately machined at right angles to the thrust force, which will be applied to the bearing. The rollers are retained in the assembly by a steel ring pinned to the outside diameter of the retainer.

### Precision Ground Housing Plate

O.D. is precision ground for a line to loose fit in housing bore. The I.D. has a turned finish and is larger than the shaft plate's I.D. Housing Plates are manufactured to conform to ABMA size and tolerance specifications. All thrust plates are accurately ground for flatness and parallelism of the roller riding and backing surfaces. The contact surfaces of the plates are super-finished to provide for long life. Locating diameters are ground to obtain an accurate fit on the shaft or in the housing.

## Options

### Materials

The plates and rollers are made from either through-hardened or carburizing grade steel with hardness to Rockwell (Rc) 58-63. Upon request we can manufacture these components from CEVM or VIMVAR grades of material and M- 50 tool steel for high temperature applications.

## Types and Styles

### Inch Series — Single Acting

The single acting bearing is the most popular thrust bearing of the inch series. The bearing is often referred to as a “three piece thrust bearing”. One of the thrust plates is stationary with respect to the shaft and is ground in the bore for an accurate fit on the shaft. The roller assembly is located by the shaft and its inside diameter is machined to provide the correct operating clearance. The second thrust plate is stationary with the housing and is ground on the outside diameter for an accurate fit in the housing. The non-locating diameters of both thrust plates are specially designed to allow lubricant flow. The sizes range from 1 to 22 inches I.D. and 2.125 to 34 inches O.D. with dynamic capacities from 10,000 lbs to 1,620,000 lbs. These bearings are used in a variety of applications such as extruder gear drives, pumps, crane hook swivels and machine tools.

### “AT” Aligning Type

The aligning style design replaces the housing plate with aligning plates. The aligning plates are matched plates, one convex and one concave, that will correct for 3° initial static misalignment. These aligning plates are not designed for applications requiring dynamic aligning capabilities. They are designed to correct an initial misalignment prior to full loading. The concave plate (housing plate) is precision ground but not hardened.

The standard “AT” type is recommended for vertical shaft applications. Where the alignment feature is required in some horizontal shaft applications, the convex aligning plate may ride on the shaft and the plate should be modified to provide a satisfactory bearing surface in the bore. This is usually achieved by the installation of a brass bushing into the bore of the plate.

## Types and Styles continued

### Crane Hook Thrust Bearings

Crane hook bearings are similar to the single acting inch series but are specifically designed for crane hooks or similar applications where heavy thrust loads and low speeds of rotation are encountered. Crane hook bearings are simply single acting thrust bearings supplied with a weathershed. The weathershed is a steel band pressed on to the rotating plate extending to the middle of the stationary plate forming a shield to help protect the roller assembly.

The weathersheds are supplied with or without grease fittings.

This type of bearing undergoes static loading in normal applications. Our static capacities are based on a total permanent deformation of .0002 inch per inch of roller diameter and are not the ABMA basic capacity.

### “DT” Double Acting Thrust

The “DT” type thrust bearing is a double acting thrust bearing that will withstand reversal in the direction of the load at normal speeds of rotation. The center thrust plate and sleeve must be keyed to the shaft or clamped tightly between the shaft shoulders to prevent rotation of the center plate relative to the shaft. The two outer thrust plates are stationary with respect to the housing. There are two roller assemblies on either side of the center thrust plate. The center plate drives the roller assembly corresponding to the direction of the thrust load.

### “DAT” Aligning, Double Acting Thrust

This bearing is basically a combination of the “DT” type and the “AT” type. The bearing is designed to take reversals in thrust load and correct for initial static misalignment up to 3°.

## Types and Styles continued

### “SDT” Simplified Double Acting Thrust

This bearing is similar in concept to the “DT” double acting type except the design has been simplified to only one roller assembly and two thrust plates. With the load in one direction, one of the thrust plates is stationary with respect to the housing and the other thrust plate rotates. When the direction of the load is reversed, the stationary plate rotates and the rotating plate becomes the stationary plate.

To provide necessary clearance for this action, the inner and outer spacer sleeves are made wider than the combined thickness of the thrust plates and roller assembly. This bearing is recommended for applications where the direction of the thrust load changes when the bearing is stationary or rotating at slow speed.

# ROLLWAY® Cylindrical Thrust Bearings

Thrust Bearings

**Basic Construction Type:** Standard Cylindrical Roller Thrust Or Aligning Type Bearing

**Rolling Elements:** Crowned Cylindrical Rollers With Sphered Ends

**Bearing Material:** Through Hardened Or Case Carburized Bearing Grade Steel

**Series:** Medium Duty (600), Heavy Duty (700), Or Metric

**Retainer Types:** Machined Brass With Steel Retaining Ring

# Cylindrical Thrust Bearings **ROLLWAY®**

- Basic Construction Type:** Standard Cylindrical Roller Thrust Or Aligning Type Bearing
- Rolling Elements:** Crowned Cylindrical Rollers With Sphered Ends
- Bearing Material:** Through Hardened Or Case Carburized Bearing Grade Steel
- Series:** Medium Duty (600), Heavy Duty (700), Or Metric
- Retainer Types:** Machined Brass With Steel Retaining Ring

# ROLLWAY® Cylindrical Thrust Bearings

Thrust Bearings

- Basic Construction Type:** Standard Cylindrical Roller Thrust Or Aligning Type Bearing
- Rolling Elements:** Crowned Cylindrical Rollers With Sphered Ends
- Bearing Material:** Through Hardened Or Case Carburized Bearing Grade Steel
- Series:** Medium Duty (600), Heavy Duty (700), Or Metric
- Retainer Types:** Machined Brass With Steel Retaining Ring

# ROLLWAY® Cylindrical Thrust Bearings

Thrust Bearings

- Basic Construction Type:** Standard Cylindrical Roller Thrust Or Aligning Type Bearing
- Rolling Elements:** Crowned Cylindrical Rollers With Sphered Ends
- Bearing Material:** Through Hardened Or Case Carburized Bearing Grade Steel
- Series:** Medium Duty (600), Heavy Duty (700), Or Metric
- Retainer Types:** Machined Brass With Steel Retaining Ring

## Self Aligning Cylindrical Roller Thrust Bearings (continued)

 Not all parts are available from stock. Please contact customer service for availability (800) 626-2120.  
 For more information on bearing capabilities outside of our standard offering, please contact Application Engineering (800) 626-2093.

# Cylindrical Thrust Bearings **ROLLWAY®**

**Basic Construction Type:** Standard Cylindrical Roller Thrust Or Aligning Type Bearing

**Rolling Elements:** Crowned Cylindrical Rollers With Sphered Ends

**Bearing Material:** Through Hardened Or Case Carburized Bearing Grade Steel

**Series:** Medium Duty (600), Heavy Duty (700), Or Metric

**Retainer Types:** Machined Brass With Steel Retaining Ring

## Rollway Tapered Thrust Bearings

Rollway Tapered Thrust bearings utilize crowned tapered rolling elements separated by a machined brass roller riding retainer (cage) contained within precision ground shaft and housing plates. Inherent to the design, the self centering action of the tapered rollers provide “true rolling motion”. These attributes counteract the natural gravitational forces on the roller assembly when subjected to horizontal applications. Tapered thrust bearings are intended for high axial loads (load parallel to the axis of rotation). There are 3 types of Tapered Thrust bearings available, TTHD, TTVF, and Self Aligning TTVF. Depending on your preference, these bearings are available in a wide variety of sizes and options as illustrated on the pages to follow.

For a given shaft size and approximate envelope, the tapered thrust bearing’s dynamic capacity is considerably greater than a cylindrical roller bearing.

# Tapered Thrust Nomenclature

## Standard Thrust Nomenclature

**Type Designator**

T - TTHD Style Thrust

**Size Designator**

Reference Catalog For Sizes.

**Variation Code**

- A - Variation From Standard - Consult Catalog Or Application Engineering
- F - Full Complement Of Rollers
- V - Bearing Plates And Rollers Made From VIMVAR Or CEVM Steel

**T - 911 - A**

## T-Flat Nomenclature

**Type Designator**

T-F - TTVF Style

T-FS - TTVF Style With 2 Piece Aligning Plate

**Size Designator**

Bearing Bore And Outside Diameter Size. The First Three Digits Are The Bore Size And The Second Three Digits Are The O.D. Size. Example: 050105 Refers To A 5 Inch Bore And 10.5 Inch O.D.

**Variation Code**

201 To 215 Are Numerically Assigned Codes That Designate The Variation From Standard (Example 201 = 1st Variation, 202 = 2nd Variation, Etc.). These Bearing Code Numbers Do Not Reference The Modification From Standard. Application Engineering Must Be Contacted For Information Concerning A Particular Modification.

**T - 050105 - F 201**

## Features and Benefits

### Superior Performance in Horizontal Shaft Applications

Tapered thrust bearings have been found to have superior performance in horizontal shaft applications. The self centering action of the rollers helps counteract the gravitational effect of the roller assembly, thus reducing the possibility of the roller assembly contacting the shaft.

### Steel

The plates and rollers are made from case hardened carburizing bearing grade steel. Upon request we can manufacture the components from CEVM or VIMVAR grades of material.

### Precision Ground Inner and Outer Plates

All thrust plates are accurately ground for flatness and parallelism of roller riding and backing surfaces. Locating diameters are ground to obtain an accurate fit on the shaft or in the housing. The surfaces of the plates are ground to provide a long operating life. The guide rib on the tapered plates is spherically ground to match the roller and reduce friction. All tapered thrust plates are designed to be used with a full complement of rollers, which makes it possible to supply this version for any size. Rollway tapered thrust plates are manufactured from Carburizing Bearing Grade Steel. The surfaces are precision ground to ABMA standards. Unlike the cylindrical thrust, these plates can be used as either the shaft or housing plate.

### Precision Ground Tapered Rollers

All rolling elements are precision ground and graded to provide an even distribution of load over the contact surfaces. Rollers are crowned for optimum contact stress patterns by reducing the end stress between the roller and the thrust plates. The large ends of the rollers are spherically ground. This provides controlled contact between the rollers and the guide rib, thus enhancing the flow of lubricant. These rollers are manufactured from Carburizing Bearing Grade Steel.

### Machined Brass Retainer

The TTHD taper thrust bearing retainers are machined from a single piece of centrifugally cast brass. The retainer is designed to pilot on the thrust plates' flanges. The roller pockets are accurately machined at right angles to the thrust force which will be applied to the bearing. By virtue of their design, tapered thrust bearings provide true rolling motion when compared to cylindrical thrust bearings whose rollers tend to have a minimal amount of slippage due to the fundamental design.

## Features and Benefits continued

### Pin through Steel Type Retainer – T-Flat Type

The T-Flat retainers are “pin through” style (pins extend through the center of the roller). The retainer consists of two steel rings through which the hardened steel pins are secured. An alternate design is a retainer machined from a single piece of centrifugally cast brass with each roller retained by two pins.

## Types and Styles

### Standard Tapered Thrust Style

Rollway tapered thrust bearings (TTHD Style) are engineered for applications that are under the harshest industrial conditions. These bearings feature tapered rollers positioned between two plates with tapered raceways.

The tapered thrust differs significantly from the cylindrical roller thrust as there is true rolling motion with the vertex of the conical sections intersecting the bearing axis. When the bearing is loaded, the rollers exhibit an outward force that is countered by the plate’s outer guide rib. The large spherical end of the roller is counter bored to help improve lubrication between the roller and guide rib. By virtue of the additional contact surface these bearings will have a higher dynamic capacity than a similar sized, cylindrical roller thrust bearing.

### T-Flat Style

The T-Flat is similar to the TTHD style except one plate is flat. The guide rib on the one tapered raceway resists the induced radial force component caused by the inclined plane while the flat plate allows radial displacement without adversely affecting bearing operation. Maximum capacity is achieved through close spacing of rollers through the use of a steel, pin type retainer.

## Rollway Tandem Thrust Bearings

Rollway Tandem Thrust bearings are also known as “multi-stage thrust” bearings. Tandem Thrust bearings are comprised of “stages” which include precision ground and matched thrust plates and compression sleeves separated by cylindrical roller assemblies. This design enables the Tandem Thrust bearings to provide a solution in a radial restricted envelope. The bearings are available in multiple stages, 2-8 to accommodate your design requirements. Depending on your preference, these bearings are available in a wide variety of sizes and options as illustrated on the pages to follow.

## Features and Benefits

### Minimal Backing Support Requirements

The tandem thrust design permits the use of minimal shaft and housing shoulders required by some applications. The cantilevering action of the thrust plates and use of compression sleeves enable these bearings to be used effectively where only minimal shaft and housing shoulder exist.

### Space Saving Design

The use of a tandem thrust bearing enables the designer to create a gearbox with high thrust capacity within a small space. The end result is a gearbox with a smaller footprint. The drawings below are a comparison of three different thrust bearings with similar dynamic capacity. This illustrates the dramatic reduction in outside diameter associated with the tandem thrust bearings.

**T752 Cylindrical Thrust**  
Dynamic Capacity=375,500 lbs  
O.D.=14"

**T-511 Tapered Thrust**  
Dynamic Capacity=322,500 lbs  
O.D.=10.5"

**TMF-030127-201**  
**6-Stage Tandem Thrust**  
Dynamic Capacity=329,900 lbs  
O.D.=5"

## Features and Benefits continued

### Matched Precision Ground Rollers

Rollers are manufactured from Carburized Bearing Grade Steel. The surfaces are ground and superfinished. The outside diameters are heavily crowned. The ends have a large machined radius designed to reduce friction between the roller and the retaining ring. The larger bearings use multiple rollers per pocket to minimize slippage.

### Machined Brass Roller Riding Retainer

Retainers are manufactured from brass. The roller slots are accurately machined to provide smooth operation of the roller assembly. The rollers are retained by a steel band placed over the outside diameter of the retainer.

### Precision Ground Inner and Plates

Plates are manufactured from Carburizing Bearing Grade Steel. The surfaces are precision ground and superfinished.

### Precision Ground Inner and Outer Compression Sleeves

Compression Sleeves are manufactured from various materials designed to provide controlled deflection. These components are match ground with the plates.

## Custom Capabilities

Detailed Drawings are available on the listed Tandem Thrust bearing designs. Upon request for a specific part number, a drawing will be sent containing the information in the following drawing along with the rated dynamic capacity. Shaft and housing fits are also available upon request.

New designs can be engineered and produced in small volumes for example combination radial and thrust bearings, concave and convex designs, screw down thrust, etc.. Contact Application Engineering for assistance in developing a tandem bearing design that will satisfy your application requirements. Based on your design envelope, loads, speeds and desired life, our engineers will design a tandem thrust bearing for your application. Let our Application Engineering Staff help you.

# ROLLWAY® Tandem Thrust Bearings

Thrust Bearings

**Basic Construction Type:** Multi Stage Cylindrical Roller Thrust Bearing

**Rolling Elements:** Crowned Cylindrical Rollers

**Bearing Material:** Through Hardened Or Case Carburized Bearing Grade Steel

**Series:** 2, 3, 4, 6, Or 8 Stages

**Retainer Types:** Machined Brass

## Load Ratings and Life

### Life Calculations

The L10 (rating) life for any given application and bearing selection can be calculated in terms of millions of revolutions by using the bearing Basic Dynamic Rating and applied thrust load. The L10 life for any given application can be calculated in terms of hours, using the bearing Basic Dynamic Rating, applied load and suitable speed factors, by the following equation:

For thrust cylindrical roller and thrust tapered roller bearings:

$$L_{10} = \left(\frac{C}{P}\right)^{10/3} \times \frac{1,000,000}{60 \times n} = \left(\frac{C}{P}\right)^{10/3} \times \frac{16667}{n}$$

Where:

$L_{10}$  = The # of hours that 90% of identical bearings under ideal conditions will operate at a specific speed and condition before fatigue is expected to occur.

C = Basic Dynamic Rating (lbs)  
1,000,000 Revolutions

P = Constant Equivalent Load (lbs)

n = Speed (RPM)

Additionally, the ABMA provides application factors for all types of bearings which need to be considered to determine an adjusted Rated Life ( $L_{na}$ ). L10 life rating is based on laboratory conditions yet other factors are encountered in actual bearing application that will reduce bearing life.  $L_{na}$  life rating takes into account reliability factors, material type, and operating conditions.

$$L_{na} = a_1 \times a_2 \times a_3 \times L_{10}$$

Where:

$L_{na}$  = Adjusted Rated Life.

$a_1$  = Reliability Factor. Adjustment factor applied where estimated fatigue life is based on reliability other than 90% (See Table No 1).

$a_2$  = Material Factor. Life adjustment for bearing race material. Regal Power Transmission Solutions bearing races

Table No. 1 Life Adjustment Factor for Reliability

Reliability %	$L_{na}$	$a_1$
90	L10	1
95	L5	0.62
96	L4	0.53
97	L3	0.44
98	L2	0.33
99	L1	0.21
50	L50	5

are manufactured from bearing quality steel. Therefore the  $a_2$  factor is 1.0.

$a_3$  = Life Adjustment Factor for Operating Conditions. This factor should take into account the adequacy of lubricant, presence of foreign matter, conditions causing changes in material properties, and unusual loading or mounting conditions. Assuming a properly selected and mounted bearing having adequate seals and lubricant operating below 250°F and tight fitted to the shaft, the  $a_3$  factor should be 1.0.

## Load Ratings and Life Continued

Vibration and shock loading can act as an additional loading to the steady expected applied load. When shock or vibration is present, an a3 Life Adjustment Factor can be applied. Shock loading has many variables which often are not easily determined. Typically, it is best to rely on one's experience with the particular application. Consult Application Engineering for assistance with applications involving shock or vibration loading.

The a3 factor takes into account a wide range of application and mounting conditions as well as bearing features and design. Accurate determination of this factor is normally achieved through testing and in-field experience. Regal Power Transmission Solutions offers a wide range of options which can maximize bearing performance. Consult Application Engineering for more information.

### Variable Load Formula

Root mean load (RML) is to be used when a number of varying loads are applied to a bearing for varying time limits. Maximum loading still must be considered for bearing size selection.

$$RML^* = \sqrt[10/3]{\frac{(L_1^{10/3} N_1) + (L_2^{10/3} N_2) + (L_3^{10/3} N_3)}{100}}$$

Where:

RML = Root Mean Load (lbs.)

L<sub>1</sub>, L<sub>2</sub>, etc. = Load in pounds

N<sub>1</sub>, N<sub>2</sub>, etc. = Percent of total time operated at loads L<sub>1</sub>, L<sub>2</sub>, etc.

\* Apply RML to rating at mean speed to determine resultant life.

### Mean Speed Formula

The following formula is to be used when operating speed varies over time.

$$\text{Mean Speed} = \frac{S_1 N_1 + S_2 N_2 + S_3 N_3}{100}$$

S<sub>1</sub>, S<sub>2</sub>, etc = Speeds in RPM

N<sub>1</sub>, N<sub>2</sub>, etc = Percentage of total time operated at speeds S<sub>1</sub>, S<sub>2</sub>, etc

## Load Ratings and Life Continued

### Bearing Life In Oscillating Applications

The equivalent rotative speed (ERS) is used in life calculations when the bearing does not make complete revolutions during operation. The ERS is then used as the bearing operating speed in the calculation of the L10 (Rating) Life. The formula is based on sufficient angular rotation to have roller paths overlap.

$$\begin{aligned} \text{ERS} &= \text{Equivalent Rotative Speed} \\ \text{N} &= \text{Total number of degrees per minute through} \\ &\quad \text{which the bearing will rotate.} \\ \text{ERS} &= \frac{\text{N}}{360} \end{aligned}$$

In the above formula, allowance is made for the total number of stress applications on the weakest race per unit time, which, in turn, determines fatigue life and the speed factors. The theory behind fretting corrosion is best explained by the fact that the rolling elements in small angles of oscillation retrace a path over an unchanging area of the inner or outer races where the lubricant is prevented by inertia from flowing in behind the roller as the bearing oscillates in one direction. Upon reversal, this small area of rolling contact is traversed by the same roller in the dry state. The friction of the two unlubricated surfaces causes fretting corrosion and produces failures which are unpredictable from a normal life standpoint.

With a given bearing selected for an oscillating application, the best lubrication means is a light mineral oil under positive flow conditions. With a light oil, there is a tendency for all areas in the bearing load zone to be immersed in lubricant at all times. The full flow lubrication dictates that any oxidized material which may form is immediately carried away by the lubricant, and since these oxides are abrasive, further wear tends to be avoided. If grease lubrication must be used, it is best to consult with either the bearing manufacturer or the lubricant manufacturer to determine the best possible type of lubricant. Greases have been compounded to resist the detrimental effect of fretting corrosion for such applications.

### Static Load Rating

The “static load rating” for rolling element bearings is that uniformly distributed static radial load acting on a non-rotating bearing, which produces a contact stress of 580,000 psi (roller bearings) or 630,000 psi (ball bearings) at the center of the most heavily loaded rolling element. At this stress level, plastic deformation begins to be significant. Experience has shown that the plastic deformation at this stress level can be tolerated in most bearing applications without impairment of subsequent bearing operation. In certain applications where subsequent rotation of the bearing is slow and where smoothness and friction requirements are not too exacting, a higher static load limit can be tolerated. Where extreme smoothness is required or friction requirements are critical, a lower static load limit may be necessary.

### Minimum Bearing Load

Skidding, or sliding, of the rolling elements on the raceway instead of a true rolling motion can cause excessive wear. Applications with high speeds and light loading are particularly prone to skidding. As a general guideline, rolling element bearings should be radially loaded at least 2% of Basic Dynamic Rating. For applications where load is light relative to the bearings dynamic load rating, consult Application Engineering for assistance.

## Thrust Engineering Section

Rollway cylindrical roller thrust bearings are designed to support thrust loads (loads parallel to the axis of rotation) at relatively high speeds. Cylindrical roller thrust bearings are relatively stiff, require a minimum amount of axial space, and handle shock loading relatively well. Rollway manufactures four different styles of cylindrical roller thrust bearings:

1. Single Acting – Supports thrust or axial load in one direction.
2. Aligning – Accepts an initial static misalignment of not more than 3 degrees.
3. Double Acting – Supports thrust or axial load in two directions.
4. Crane Hook Thrust – A shielded cylindrical roller thrust bearing that supports thrust or axial load in one direction.

Rollway tapered thrust bearings (TTHD and TTVF) are engineered for applications that contain high thrust loads and heavy shock loads. These bearings feature tapered or conical rollers positioned between two plates with tapered raceways. The tapered thrust bearing allows for true rolling motion with the vertex of the conical sections intersecting the bearing axis. The large end of each tapered roller is spherically ground. When the bearing is under load, this curvature guides the rollers accurately. The large spherical end of the roller is counterbored to improve lubrication between the roller and guide rib. By virtue of the additional contact surface, these bearings will have a higher dynamic rating than a similar sized cylindrical roller thrust bearing. Furthermore, they have superior performance in horizontal shaft applications. The self-centering action of the rollers counteract the gravitational effect of the roller assembly reducing the effects of the roller assembly contacting the shaft.

The tapered thrust bearings of the TTVF style are similar to the TTHD tapered thrust style except one thrust plate is flat. The guide rib on the one tapered raceway resists the induced radial force component caused by the inclined plane while the flat plate allows radial displacement without adversely affecting bearing operation. Maximum capacity is achieved through close spacing of the rollers through the use of a steel, hardened pin type retainer.

Rollway tandem thrust bearings, also referred to as multi-stage thrust bearings, were originally designed and patented by Rollway. The bearing consists of a series of thrust plates and roller assemblies with compression sleeves separating the stages. The design of the bearing sleeves and precision match grinding of the components allow the load to be equally applied through the stages of the bearing.

The tandem design allows the use of a high capacity bearing in a small area. Popular applications for this bearing type are rotary swivels, single screw extruders, and twin screw extruders. The tandem bearing allows for the increased output of machines without increasing the size of the gearbox. Rollway manufactures tandem bearings in two, three, four, six, and eight stages. Both inch and metric series sizes are available. Bore sizes range from about 1 to 22 inches with corresponding outside diameter ranging from 3.5 to 42 inches. Rollway tandem thrust bearings are supplied to original equipment manufacturers and the aftermarket.

### Operating Conditions Factor

The life of a bearing is dependent on the operating conditions of the application. Lubrication, effects of the external environment, shaft and housing geometry and mounting, all have an effect on the actual bearing life. To determine a more realistic life calculation, the Operating Conditions Factor (F) can be included into the  $L_{10}$  life equation. The actual values determination will be based on experience of the designer and the expected operating conditions.

Using the Operating Conditions Factor (F) in the life equation,  $L_{10}$  life in hours now becomes:

$$L_{10} = F \times \left[ \left( \frac{C}{P} \right)^{3.33} \times \frac{16667}{n} \right]$$

## Thrust Engineering Section continued

Proper selection of the F factor demands intimate knowledge of the application. Where little is known of the application, it is recommended that  $F = 1$  be selected. As a guide in selecting a realistic value for F, Rollway suggests use of the following, cumulative, individual sub-factors,  $f$ , to arrive at the over-all factor, F, thus:

$$F = f_1 \times f_2 \times f_3 \times f_4 \dots$$

The table below defines the application parameters and values recommended for derivation of the individual sub-factors.

**Thrust Bearing Factors**

Factor	Application Condition	Factor Estimates	
		Poor	Excellent
$f_1$	Lubricant viscosity suitability @ bearing operating temperature (see Lubrication)	.5	1.0
$f_2$	External environment and provisions for isolation	.5	1.0
$f_3$	Operational conditions of shaft and housing squareness & rigidity	.5	1.0
$f_4$	Bearing thrust plate backing system full backing vs partial backing	.5	1.0

### Cylindrical Roller Thrust Shaft Plate

The bore of the shaft plate is precision ground for a line to loose fit on in relation to the shaft outside diameter. The shaft plate outside diameter has a turned finish and is smaller than the housing plate's outside diameter. The plate is made from either through-hardened or carburizing grade steel with hardness to Rockwell (Rc) 58-63. Upon request we can manufacture these components from either CEVM or VIMVAR grades of material or M- 50 tool steel for high temperature applications.

All thrust plates are accurately ground for flatness and parallelism of the roller riding and backing surfaces. The roller contacting surfaces of the plates are superfinished to provide for long life. Locating diameters are ground to obtain an accurate fit on the shaft.

### Cylindrical Roller Thrust Housing Plate

The outside diameter of the housing plate is precision ground for a line to loose fit in housing bore. The inside diameter has a turned finish and is larger than the shaft plate's inside diameter. The plate is made from either through-hardened or carburizing grade steel with hardness to Rockwell (Rc) 58-63. Upon request we can manufacture these components from either CEVM or VIMVAR grades of material or M- 50 tool steel for high temperature applications.

All thrust plates are accurately ground for flatness and parallelism of the roller riding and backing surfaces. The roller contacting surfaces of the plates are superfinished to provide for long life. Locating diameters are ground to obtain an accurate fit in the housing.

## Thrust Engineering Section continued

### Cylindrical Roller Thrust Roller Assembly

The roller assembly contains a machined brass roller-riding cage. Rollway thrust bearing retainers are machined from centrifugally cast brass. The retainers for all cylindrical roller thrust bearings are designed to be roller riding. The contoured roller pockets are accurately machined at right angles to the thrust force, which will be applied to the bearing. The rollers are retained in the assembly by a steel ring pinned to the outside diameter of the retainer.

The rollers in the roller assembly are matched to have outside diameters within .0001 inches. It should be noted that the Rollway design has a sphered roller end, which rides against the steel retaining ring for reduced wear. (The center of the contact point has zero velocity vs. the higher velocity that results from a flat ended roller contacting the ring.) The rollers used in cylindrical thrust roller bearings are also crowned. For the benefits of crowning please refer to page F-9.

### Tapered Thrust Bearing Plates

The tapered thrust plates and rollers are made from carburizing grade steel surface hardened to HRc 58 minimum. Other material grades such as CEVM or VIMVAR are available upon request. All thrust plates are accurately ground for flatness and parallelism of the roller riding and backing surfaces. Locating plate diameters are surface ground to obtain an accurate fit on the shaft or in the housing. The tapered roller contacting surfaces are ground to ensure satisfactory bearing operating life.

### Tapered Thrust Bearing Rollers

The tapered rolling elements are precision ground to provide an even load over the contact surfaces. The rollers are crowned for optimum stress patterns. The large end of the rollers are spherically ground providing controlled contact between the rollers and the guide rib.

### Tapered Thrust Bearing Retainer

The tapered thrust bearing retainers are of two designs. The first design is a machined retainer from a single piece of centrifugally cast brass. The second design is a two-piece retainer made from hardened steel rings.

### Tolerances

Rollway thrust bearings are produced to standard tolerances as listed in the following tables. Thrust bearings are available to increased accuracy upon request. Cylindrical roller thrust bearings contain rollers having a diameter variation of .0001 inches maximum per bearing.

### Thrust Bearing Mounting

Suitable tolerances for the shaft and housings of the 600 and 700 series thrust bearings and the tapered thrust bearings are listed in the following tables. These tolerances will provide satisfactory radial guidance for the cylindrical and/or tapered thrust bearings. For further information on bearing mounting and installation, refer to page F-56 of this catalog

## Thrust Engineering Section continued

When mounting thrust bearings, there exists the possibility of a slight press fit due to the acceptable tolerances of the bearing bore and outside diameters. Under no circumstances should a press fit exceeding the limits shown be used with the thrust plates, as any expansion or contraction in the plates due to fit could result in a misalignment in the plates and subsequent limited bearing life.

Cylindrical and tapered roller thrust bearings require the support surfaces in the housing and the shaft to be at right angles to the shaft axis within .0005 inch per inch of diameter. For example, a four inch diameter shaft should be square to the shaft shoulder within .002 inches. The support surfaces should also provide for continuous support for the bearing thrust plates across the extent of the raceways. As a general rule, the minimum shaft shoulder and maximum housing shoulder should be as follows:

- Shaft shoulder at a minimum should be equal to the outside diameter of the shaft plate.
- Housing shoulder must have a maximum diameter to not exceed the inside diameter of the housing plate.

The tapered thrust bearing plates are manufactured with the same inside diameter and outside diameter on both plates. Applications using these bearings must be designed with ample clearance between the outside diameter of the shaft plate and the housing. Clearance must also be designed between the inside diameter of the housing plate and the shaft. It is recommended to provide for clearances of approximately .030 inches.

Tandem thrust bearings are designed to allow for the use of minimal shaft and housing shoulders. The cantilevering action of the thrust plates use of compression sleeves enable these bearings to be used effectively where only minimal shaft and housing shoulders exist.

### Tandem Thrust Bearing Minimum Load

Tandem thrust bearings are designed to be used in horizontal shaft applications such as an extruder gear drive, and it is essential that a sufficient thrust load is applied to prevent roller skid. The minimum load required for tandem thrust bearings is expressed as a ratio of the bearing's dynamic rating (C) to the applied load (P). For ideal bearing operation, the C/P ratio should be less than 8. Bearing loads creating a C/P ratio greater than 12 must be avoided.

### Lubrication

The required viscosity for the lubricant on cylindrical thrust bearings is 125 SSU at operating temperature. The required viscosity for the lubricant on tapered thrust bearings is 160 SSU at operating temperature. The required viscosity for the lubricant on tandem thrust bearings is 160 SSU at operating temperature. For further information in regards to thrust bearing lubrication please refer to page A-17 of this catalog.

# ***Mounted Ball Bearings***

Modular bearing assembly consisting of sealed and lubricated inch or metric ball bearing contained within a variety of housings types, locking mechanisms, mounting styles, and housing materials. Mounted ball bearings provide an anti-friction solution when supporting rotating shafts with radial loads.

## **Housing Styles**

Pillow Block, Flanges, Take Up Assemblies

## **Locking Styles**

Setscrew, Double Setscrew, Concentric And Eccentric

## **Bore Diameter Size Range**

½" To 4 15/16" And 20 mm To 100 mm

## **Housing Materials**

Cast & Ductile Iron, Stamped Steel

## Sealmaster Gold Mounted Ball Bearings

Sealmaster Gold mounted ball bearings feature a wide outer race insert bearing with land riding metallic retainer. The black oxide treated bearing steel insert features an exclusive lock pin and dimple system providing a direct path for lubrication into the bearing, and prevents outer ring rotation within the housing. Shaft lock is achieved by either setscrew or Skwezloc® concentric locking collar. The felt seal with flinger provide a good balance between contaminant entry, GoldPlex® HP grease loss and friction. Depending on your preference, these bearings are available in both inch and metric shaft sizes with a wide variety of cast iron, stamped steel or rubber mount housings, sealing, and lubrication options or industry specific solutions as illustrated on the pages to follow.

# Sealmaster Gold Mounted Ball Nomenclature

## Housing Units

**Prefix**

E - Expansion Unit

**Housing\*** (see table below)

D - Double Setscrew Locking

**Bore Size**

Inch - ##/16 (ex. 20/16 = 1 1/4")

R for 1 1/4" and 2" Reduced Only

Metric - Standard Duty - 2##, ## x 5 mm  
(ex. 05 = 25 mm)

Medium Duty - 3##, ## x 5 mm  
(ex. 07 = 35 mm)

**Standard Option**

T - Skwezloc® Locking Collar

M - Metric Hardware (Metric-SKWEZ™)

C - Contact Seal

**Common Options\*** (see table below)

*Housing	Housing Style	Bearing Duty
FB	Flange Bracket	Standard
MFC	Piloted Flange Cartridge	Medium
MFP	Four Bolt Pillow Block - High Base	Medium
MP	Pillow Block - High Base	Medium
MSC	Cylindrical Cartridge	Medium
MSF	Four Bolt Flange	Medium
MSFPD	Four Bolt Pillow Block - High Base	Medium
MSFT	Two Bolt Flange	Medium
MSPD	Four Bolt Pillow Block - High Base	Medium
MST	Wide Slot Take Up	Medium
NP	Pillow Block - High Base	Standard
NPL	Pillow Block - Low Base	Standard
RB	Rubber Mount Insert Only	Standard
SC	Cylindrical Cartridge	Standard
SF	Four Bolt Flange	Standard

# Sealmaster Gold Mounted Ball Nomenclature

## Center Pull Take Up Frame Assemblies

## Top Mount Take Up Frame Only

## Features and Benefits

### Wide Outer Ring

Sealmaster has the industry's widest outer ring. The black oxidized outer ring is 20 to 30% wider than industry standard outer rings. This feature results in increased grease capacity, and room for improved sealing options. A wider outer ring has increased surface area contact with the housing to better absorb shock load.

### Lock Pin and Dimple

The Sealmaster exclusive locking pin and dimple system provides a direct lubricant path into the bearing cavity & ball path instead of around a lubrication groove. The pin also prevents outer ring rotation (sometimes referred to as "creep"), and allows  $\pm 2^\circ$  static misalignment of the bearing insert.

### Multiple Sealing Options Felt Seal with Flinger

The standard felt seal provides a tight labyrinth seal which retains lubrication and acts as a filter to exclude contamination. The external stamping is a flinger which shields the felt from large contaminants and directs them away from the sealing surface. The design operates with less drag and less heat generation than rubber contact seals.

### Single Lip Contact Seal

Single Lip Contact Seal consists of a nitrile rubber washer in metal shroud to shield the lip from large contaminants. The seal is designed to balance drag and protection in wet and dry environments. This can be specified by adding the suffix C to the part number.

Additional Sealing Options can be found in the Custom Select section on pages G-24 to G-27.

### Multiple Locking Methods Setscrew Locking

120° spaced, balanced three point contact minimizes inner ring distortion vibration, reduces noise, and improves reliability. Precision manufactured diamond faceted setscrews contribute to improved clamping and resistance to back out.

### Skwezloc® Concentric Locking Collar

SKWEZLOC is a concentric locking collar clamp design that results in near-perfect concentricity of the shaft to bearing bore and maintains near perfect ball path roundness, while reducing fretting corrosion. This design eliminates the shaft damage of setscrew locking, and minimizes bearing induced vibration for smoother quieter operation. The collar has a TORX head cap screw that outlasts stripping 12 times longer than hex head cap screws.

## Features and Benefits continued

### Zone Hardened Inner Race

Sealmaster incorporates a unique heat treat process that hardens the inner race only where it is needed...under the ball path. The black oxidized zone hardened inner race results in improved lock reliability as a result of less distortion at the setscrew location and improved thread conformity resulting in improved clamping and resistance to setscrew back-out

### Land Riding Retainer

The Sealmaster unique land riding metal retainer design provides superior pocket clearance that allows for 360° grease circulation around the rolling elements resulting in better retained and utilized lubrication. The land riding design of the retainer minimizes wear on both Ball and retainer, while maximizing stability, which is especially important in applications involving vibration, shock loading or high operating speeds.

### Solid Base

Solid bases are standard on Sealmaster Gold ball bearing pillow blocks. The solid base provides improved stability, resistance to shock and vibration and prevents frame buckling under base compared to semi-solid and hollow mounting bases.

### Housing Fit

All bearings are assembled with a controlled housing fit between the bearing outer ring and housing bore. This fit allows the bearing to properly self-align in common industrial applications. Special fits are available based on your specific application need.

### Nameplate

Metal nameplate riveted to the housing allows for easy identification even after years of operation.

## Options

### Sealmaster Gold Mounted Ball Bearing Options

Bearings are typically selected using L10 fatigue life calculations based on ideal operating conditions. However, most bearing problems are not fatigue related, but occur due to contamination, lubrication starvation, or other environmental issues. As a result, our engineers have developed custom solutions to meet the varying severity, operating parameters and maintenance regularity, such as Reduced Maintenance and Custom Select.

### Reduced Maintenance “RM”

Sealmaster Reduced Maintenance bearings are the result of a patented Tapered Lands bearing race profile which means that critical lubricant is circulated more efficiently, while requiring no regular service intervals. The bearing are supplied from the factory with a plug instead of a lubrication fitting.

The outer land surface in a conventional bearing is parallel to the axis of the inner ring. The Tapered Lands surface is tapered in a radial direction toward the bearing race. This subtle yet crucial design change allows lubricant to more easily flow back to the raceway. With improved bearing lubricant circulation comes significantly longer bearing service life. This improved circulation and service life comes without any reductions in bearing radial or thrust capacities.

\* For bearings that are maintained and relubricated on a regular basis, there is no significant difference in expected service life.

# Custom Select

Sealmaster Custom Select options are available in popular shaft sizes from 1/2" to 2 7/16" in common housing configurations.

## High Temperature

Suffix	Description	Temperature	Environment	Speed Limits
HT*	Standard High Temp	200°F to 400°F	Dry/Dusty	pages G-235 to G-240
HI*	High Performance High Temp			
HTA*	High Temp Air Handling		Wet/Moisture	
HTC*	High Temp Contact Seal			

\*For expansion units add an E prefix (example: ENP-23 HTA). Information on expansion units can be found on page G-29.

### High Temperature "HT"

High temperature bearing with increased radial internal clearance to accommodate thermal expansion of components and Nomex\* seal and high temperature synthetic grease.

### High Performance High Temperature "HI"

High temperature bearing with increased radial internal clearance to accommodate thermal expansion of components and Nomex\*\* seal and Krytox\* 226 grease. Available in expansion version in some sizes with half-dog and wire, suffix "HIY", see page G-104 for more information.

### High Temperature Air Handling "HTA"

Utilizes the same features as our high temperature "HT" option with the additional features that are important in Air Handling equipment:

- Controlled air handling housing fit that allows the bearing to properly self-align when mounted on light weight frames
- Two stage noise testing verification procedure for quiet operation
- For standard operating temperatures, consider the Air Handling "CXU" option shown on following pages

### High Temperature Contact Seal "HTC"

High temperature bearing with increased radial internal clearance to accommodate thermal expansion of components, single lip silicone fiberglass or FKM spring seal and high temperature synthetic grease.

## Custom Select continued

### High Contamination

Suffix	Description	Temperature	Environment	Speed Limits
DRT	Highly Contaminated	-40°F to 200°F	Highly Contaminated	pages G-235 to G-240

2C Seal

3C Seal

#### High Contamination “DRT”

Heavy Duty Multi-Lip contact seal (depending on size and series, either supplied with “2C” double lip or “3C” triple lip seal), 100% Grease Fill with Sealmaster GoldPlex HP Grease.

### High Speed

Suffix	Description	Temperature	Environment	Speed Limits
HS	High Speed	-40°F to 200°F	Dry/Dusty	pages G-235 to G-240

#### High Speed “HS”

- Available in SKWEZLOC locking collar only
- Backed off, felt seal reduces contact area between the felt sealing material and the internal metal flinger
- Controlled air handling housing fit that allows the bearing to properly self-align when mounted on lightweight frames
- Increased radial internal clearance to accommodate radial thermal expansion of components

# Custom Select continued

## Air Handling

Suffix	Description	Temperature	Environment	Speed Limits
CXU	Air Handling	-40°F to 200°F	Dry/Dusty	pages G-235 to G-240
HTA*	High Temp Air Handling	200°F to 400°F		

\*For expansion units add an E prefix to unit assembly (example: EMP-23 HTA)

### Air Handling “CXU”

Utilizes many of the same features as standard Sealmaster Gold Mounted Ball Bearings but designed and manufactured for Air Handling equipment.

- Controlled air handling housing fit that allows the bearing to properly self-align when mounted on lightweight frames
- Available with the standard Sealmaster felt seal for decreased energy consumption
- Two stage noise testing verification procedure for quiet operation

### High Temperature Air Handling “HTA”

Features listed on page G-24

## Custom Select continued

### Low Drag

Suffix	Description	Temperature	Environment	Speed Limits
LO	Low Drag	-20°F to 180°F	Dry/Dusty	pages G-235 to G-240
XLO	Extra Low Drag	-20°F to 100°F		

### Low Drag “LO”

- Felt seal cut down to reduce drag
- Provides excellent barrier that works to retain grease and acts as a filter to reduce the ingress of debris contaminants
- Features a channeling grease that reduces drag while lubricating the bearing
- A reduced housing fit to allow for the bearing to properly self-align on light weight frames

### X-Tra Low Drag “XLO”

- Felt seal cut down and oil soaked for extra low drag
- Oil lubricated and supplied with an adapter and plug for easy field relubrication
- A reduced housing fit to allow for the bearing to properly self-align on light weight frames

## Bearing Rotational Torque - Comparison Chart

	Company	Suffix Option	Seal Type	Lubrication
LO Drag Bearing Options	AMI®	FS	Non-Contact	Oil
	Sealmaster	XLO	Low Drag Felt	Oil
	MB®	HFF	Steel Labyrinth	Oil
	Peer®	ZSFF	Steel Labyrinth	Oil
	Sealmaster	LO	Low Drag Felt	Grease
	MB	MHFF	Steel Labyrinth	Grease

	Peer	ZMKFF	Steel Labyrinth	Grease
Standard Bearing Drag (Reference)	Sealmaster	-	Felt	Grease
	Sealmaster	C	Contact	Grease

# Custom Select continued

## Optional Fittings

Suffix	Description
CSK	90° Grease Fitting
CSJ	45° Grease Fitting
CTJ	Adapter and Plug
CTY	Plug
W	Adapter and Grease Fitting

**CSK – 90° Grease Fitting**

**CSJ – 45° Grease Fitting**

**CTJ – Adaptor and Plastic Plug**

**CTY - Plug**

**W – Adaptor and Grease Fitting**

### Note:

- Fittings are designed to properly position the lock pin anti-rotation device. Other fittings not designed for Sealmaster brand bearings may not provide this function causing reduced bearing life.
- Fittings are factory adjusted to properly position the lock pin anti-rotation device. Improper field adjustment of the fitting may cause reduced bearing life. Consult Bearing Technical Services for proper adjustment techniques or review installation instructions.
- For specific hole sizes per housing assembly refer to section L - Accessories.

## Additional Options

### Expansion Units Options

Axial shaft expansion is compensated by a non-expansion (fixed) and expansion (float) arrangement. Many bearings are offered in both fixed and float arrangements and have identical mounting dimensions. It is recommended to use both units on one shaft in high temperature applications to help account for linear shaft expansion. For more information see page G-249 in the Mounted Ball Bearing Engineering section.

• Expansion option exists for the bearing and housing combination

Note: 1. Not all combinations of housing styles, locking types and seal options are available. Consult customer service for availability and possible set-up charges.

2. Alternate expansion version available in some sizes and configurations with half-dog and wire, suffix "HIY", see page G-104 for more information.

## Additional Options

### Greases

Optional greases are readily available, consult Application Engineering for complete list

#### High Temperature Synthetic

- Used in HT, HTA, and HTC suffix modified bearings
- High quality, synthetic hydrocarbon, lithium complex thickened grease NLGI#2, and ISO 220 viscosity
- Superior high temperature (200 F to 400F) stability

#### KRYTOX\* Extended Lube

- Used in HI suffix modified bearings
- KRYTOX GPL 226, an extremely high performance perfluorinated oil and PTFE thickened grease
- KRYTOX grease has a superior service life and therefore diminishes re-lubrication frequency and extends life
- Engineers have found that, compared to other high temperature greases, the thermal stability and lubricity of the KRYTOX can improve high temperature bearing life by a factor of 4 to 45 times

## Custom Capabilities

Additional Industry specific options exist such as the:

- Sealmaster Paver Bearing – page G-127
- Sealmaster Material Handling Bearing - page G-109
- Sealmaster PN Gold – Corrosion Resistant – page K-29

Our Application Engineers will design a bearing based on your unique application parameters, utilizing a variety of existing components or special components. By combining your equipment knowledge and our Application Engineers bearing expertise, a product solution can be designed to maximize bearing performance in your specific application.

Thousands of customers benefit from this capability every year, and now you no longer have to endure the lead time associated with these custom engineered solutions. In many cases, a higher performance product can be designed and developed specifically for your application.

# SEALMASTER® Performance Mounted Ball Bearings

**Duty:** Standard  
**Rolling Elements:** Ball  
**Housing:** Cast Iron Piloted Flange Cartridge  
**Self Alignment:** +/- 2 Degrees  
**Lock:** Setscrew  
**Seal:** Felt  
**Optional Seal:** Contact  
**Temperature:** -20° to 220°F

\* Misalignment capability reduced as a result of SKWEZLOC collar clearance.  
 For Medium Duty SKWEZLOC Locking Collar Bearing inserts see page G-96.  
 For Housing fit guidelines see page G-261.  
 For Replacement Lock Collar see page G-98.

Metric dimensions for reference only.

Not all parts are available from stock. Please contact customer service for availability (800) 626-2120.

For more information on bearing capabilities outside of our standard offering, please contact Application Engineering (800) 626-2093.

**Duty:** Standard  
**Rolling Elements:** Ball  
**Housing:** Cast Iron Wide Slot Take Up  
**Self Alignment:** +/- 2 Degrees  
**Lock:** Setscrew  
**Seal:** Felt  
**Optional Seal:** Contact  
**Temperature:** -20° to 220°F

The STH series style H, are side mounting frame take-up units designed to incorporate the ST series take-up units (see pages G-72 to G-74), as indicated in the accompanying charts. They are used where shaft adjustment and/or belt tightening is required in conveyor applications. They are manufactured from heavy gauge structural steel members and equipped with heavy duty Acme (square) threads for positive action. Adjustment is made by turning the square head with an open end wrench. For SKWEZLOC Locking Collar add T suffix example STH-23T-12 For Contact Seal add C suffix example STH-23C-12

<b>Duty:</b>	Medium

The MSTH series style H, are side mounting take-up units designed to incorporate MST series take-up units (see page G-80) as indicated in the table above. They are used where shaft adjustment and/or belt tightening is required in conveyor applications. They are manufactured from heavy gauge structural steel members and equipped with heavy duty Acme (square) threads for positive action. Adjustment is made by turning the square head with an open wrench.

Metric dimensions for reference only.

Not all parts are available from stock. Please contact customer service for availability (800) 626-2120.

For more information on bearing capabilities outside of our standard offering, please contact Application Engineering (800) 626-2093.

\*Reduced Housing

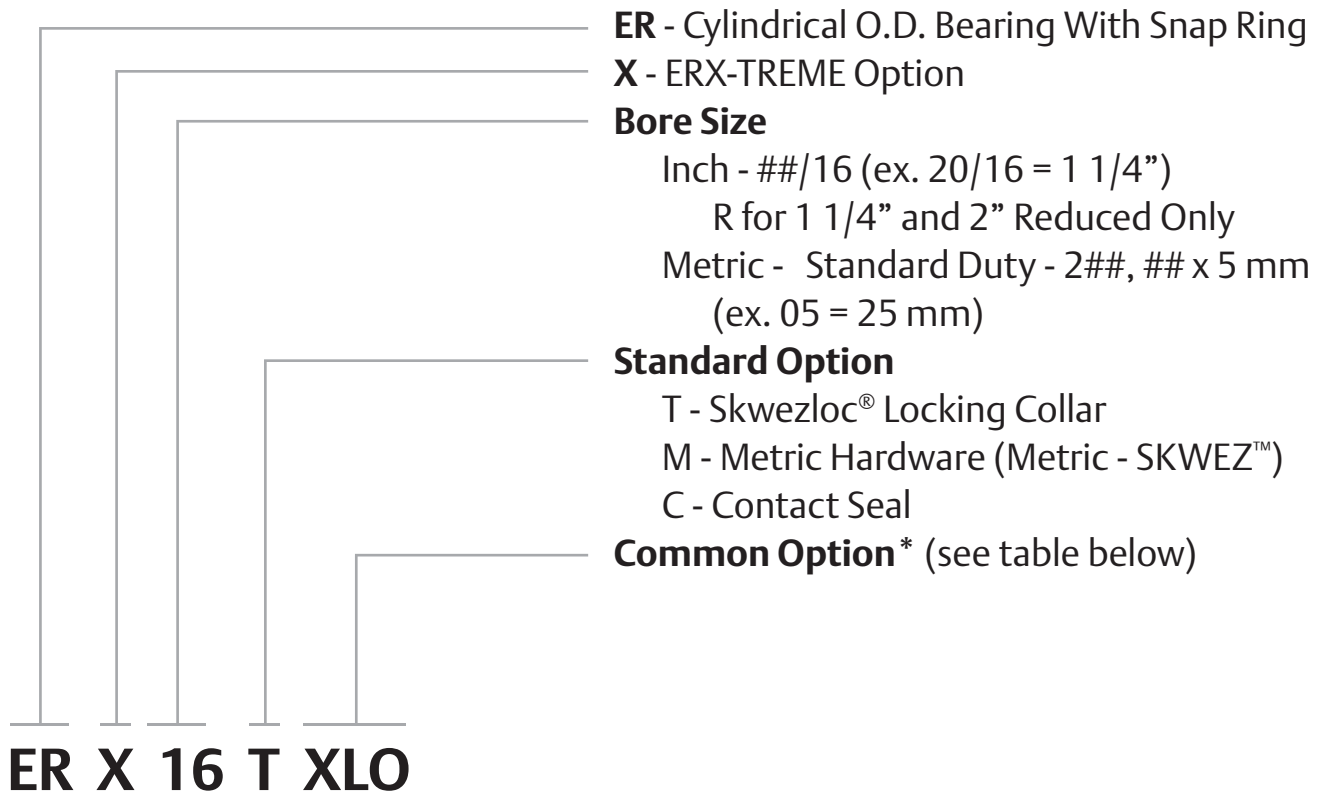

## Sealmaster ER Style Ball Bearings

Sealmaster Gold ER bearings feature a cylindrical OD and snap ring for easy installation in a roll assembly. Shaft lock is achieved by either setscrew or Skwezloc® concentric locking collar. The felt seal with flinger provide a good balance between contaminant entry, GoldPlex HP™ grease loss and friction. Depending on your preference, these bearings are available in both inch and metric shaft sizes with a wide variety of sealing and lubrication options or ERX-TREME industry specific solutions as illustrated on the pages to follow.

## ER Style Nomenclature

### Common Option

- 3C** Triple Lip Contact Seal - replaced by DRT in most sizes
- DRT** High Contamination
- HI** ERX-Treme High Temperature Krytox\* Grease
- HIY** ERX-Treme High Temperature Krytox\* Grease Expansion
- LO** ERX-Treme Low Drag
- X** Labyrinth Seal
- XLO** ERX-Treme Extra Low Drag

\*Note: Configurations are not available in all sizes or housing styles. Consult the product tables, option sections and engineering sections for more detail or consult a Bearing Application Engineer.

\*\*KRYTOX is a registered trademark of E.I. du Pont de Nemurs and Company. This trade name, trademark and/or registered trademark is property of their respective owner and is not owned or controlled by Regal Power Transmission Solutions.

## Features and Benefits

### Outer Race With Tapered Lands

The Sealmaster ER Bearings Outer Ring is black oxidized and comes standard with a locating ring and lubrication groove and lubrication inlet. In addition, they have the Sealmaster patented Tapered Lands bearing race profile which means that critical lubricant is circulated more efficiently, while requiring no regular service intervals. The outer land surface in a conventional bearing is parallel to the axis of the inner ring. The Tapered Lands surface is tapered in a radial direction toward the bearing race. This subtle yet crucial design change allows lubricant to more easily flow back to the raceway. With improved bearing lubricant circulation comes significantly longer bearing service life. This improved circulation and service life comes without any reductions in bearing radial or thrust capacities.

\* For bearings that are maintained and relubricated on a regular basis, there is no significant difference in expected life.

### Multiple Sealing Options Felt Seal With Flinger

The standard felt seal provides a tight labyrinth seal which retains lubrication and acts as a filter to exclude contamination. The external stamping is a flinger which shields the felt from large contaminants and directs them away from the sealing surface. The design operates with less drag and less heat generation than rubber contact seals.

### Single Lip Contact Seal

Single Lip Contact Seal consists of a nitrile rubber washer in metal shroud to shield the lip from large contaminants. The seal is designed to balance drag and protection in wet and dry environments. This can be specified by adding the suffix C to the part number.

Additional Sealing Options can be found on pages G-103 to G-106.

## Features and Benefits continued

### Multiple Locking Methods Setscrew Locking

120° spaced, balanced three point contact minimizes inner ring distortion vibration, reduces noise, and improves reliability. Precision manufactured diamond faceted setscrews contribute to improved clamping and resistance to back out.

### Sealmaster Skwezloc<sup>®</sup> Concentric Locking Collar

SKWEZLOC is a concentric locking collar clamp design that results in near-perfect concentricity of the shaft to the bearing bore and maintains near perfect ball path roundness, while reducing fretting corrosion. This design eliminates the shaft damage of setscrew locking, and minimizes bearing induced vibration for smoother quieter operation. The collar has a TORX head cap screw that outlasts stripping 12 times longer than hex head cap screws.

### Zone Hardened Inner Race

Sealmaster incorporates a unique heat treat process that hardens the inner race only where it is needed...under the ball path. The black oxidized zone hardened inner race results in improved lock reliability as a result of less distortion at the setscrew location and improved thread conformity resulting in improved clamping and resistance to setscrew back-out.

### Land Riding Retainer

The Sealmaster unique land riding metal retainer design provides superior pocket clearance allows for 360° oil circulation around the rolling elements resulting in better retained and utilized lubrication.

## Options

Bearings are typically selected using L10 fatigue life calculations based on ideal operating conditions. However, most bearing problems are not fatigue related, but occur due to contamination, lubrication starvation, or other environmental issues. As a result our Bearing engineers have developed custom solutions to meet the varying severity, operating parameters and maintenance regularity, such as ERX-TREME and Custom Select.

### ERX-TREME Options Low Drag

Suffix	Description	Temperature	Environment	Speed Limits
LO	Low Drag	-20°F to 180°F	Dry/Dusty	Pages G-235 to G-240
XLO	Extra Low Drag	-20°F to 100°F		

#### ERX-TREME Low Drag “LO”

- Felt seal cut down to reduce drag
- Provides excellent barrier that works to retain grease and acts as a filter to reduce the ingress of debris contaminants
- Features a channeling grease that reduces drag while lubricating the bearing

#### ERX-TREME X-Tra Low Drag “XLO”

- Felt seal cut down and oil soaked for extra low drag
- Oil lubricated

### Bearing Rotational Torque - Comparison Chart

	Company	Suffix Option	Seal Type	Lubrication
LO Drag Bearing Options	AMI®	FS	Non-Contact	Oil
	Sealmaster	XLO	Low Drag Felt	Oil
	MB®	HFF	Steel Labyrinth	Oil
	Peer®	ZSFF	Steel Labyrinth	Oil

	MB	MHFF	Steel Labyrinth	Grease
	FYH®	DSK3	Non-Contact	Oil
	Peer	ZMKFF	Steel Labyrinth	Grease
Standard Bearing Drag (Reference)	Sealmaster	-	Felt	Grease
	Sealmaster	C	Contact	Grease

# ERX-TREME Options continued

## High Temperature

Suffix	Description	Temperature	Environment	Speed Limits
HI*	High Performance High Temp	200°F to 400°F	Dry/Dusty	Pages G-235 to G-240
HIY				

### ERX-TREME High Temperature "HI"

- High temperature bearing with increased internal clearance to accommodate thermal expansion of components
- High temperature Nomex seal\* and Krytox\* -226 grease

### ERX-TREME Expansion - High Temperature "HIY"

- Expansion type HI Temperature utilizes a half-dog setscrew combined with a lock wire and is recommended for applications that require expansion capability.
- High temperature bearing with increased radial internal clearance to accommodate thermal expansion of components
- High temperature Nomex seal and Krytox\* -226 grease
- Specify as ERX-xx HIY

This may be essential when shafts grow in length due to temperature changes. The single half-dog setscrew has a cylindrical nub that protrudes out of the bottom of the setscrew. The nub is used to mate loosely with a slot milled into the shafting. As the shaft spins, the nub interferes with the slot and positively turns the inner ring. See HIY installation instructions.

Note: All expansion bearings must be used in conjunction with a fixed bearing to stabilize the system.

### KRYTOX Extended Lube Grease

- Used in HI and HIY suffix modified bearings
- KYRTOX GPL 226, an extremely high performance perflourinated oil and PTFE thickened grease
- KRYTOX grease has a superior service life and therefore diminishes re-lubrication frequency and extends life
- Engineers have found that, compared to other high temperature greases, the thermal stability and lubricity of the KRYTOX can improve high temperature bearing life by a factor of 4 to 45 times

## Custom Select

### High Contamination

Suffix	Description	Temperature	Environment	Speed Limits
DRT	Highly Contaminated	-20°F to 200°F	Highly Contaminated	Pages G-235 to G-240

2C Seal

3C Seal

### High Contamination “DRT”

Heavy Duty Multi-Lip contact seal (depending on size and series, either supplied with “2C” double lip or “3C” triple lip seal), 100% Grease Fill with Sealmaster GoldPlex HP Grease.

For Housing fit guidelines see page G-259. For Replacement Lock Collar see page G-98.

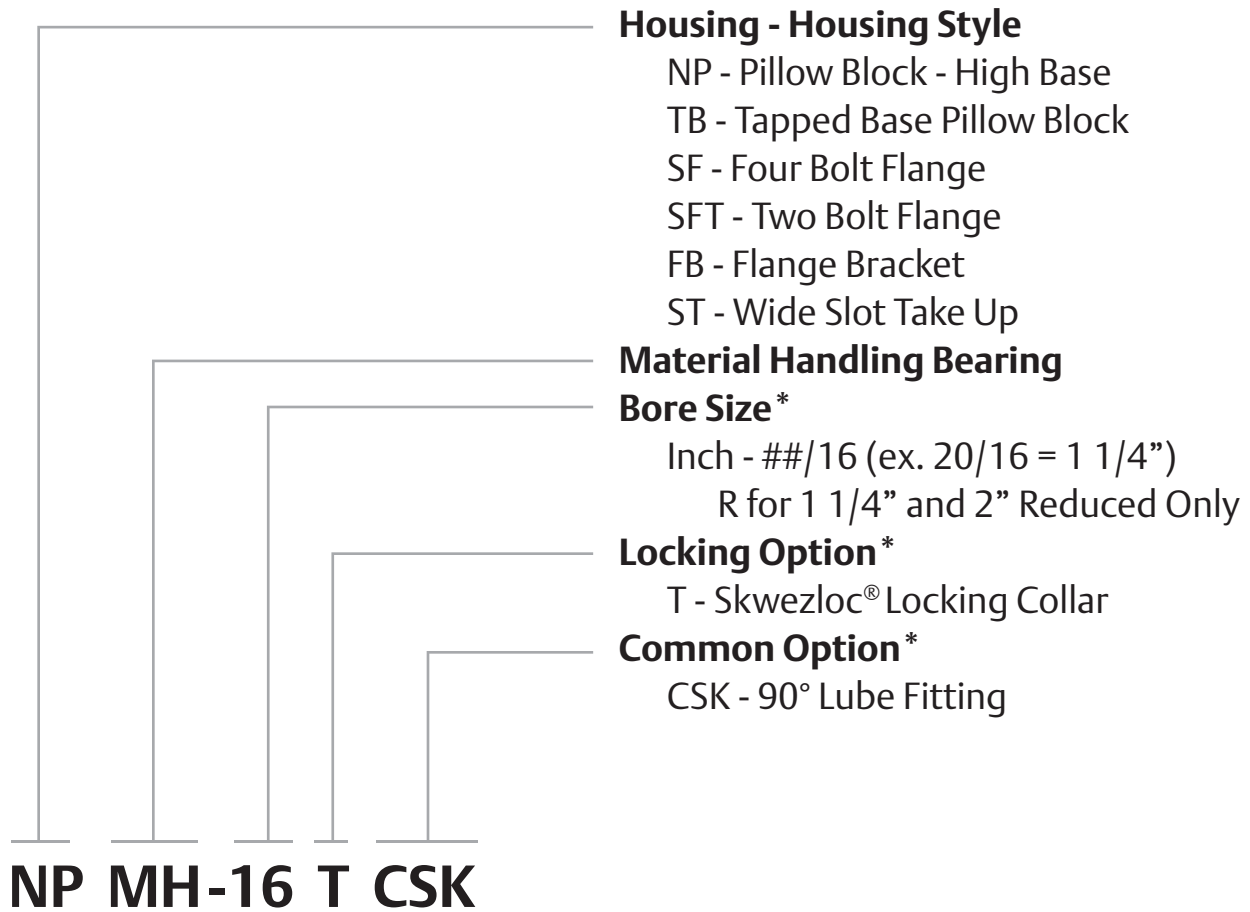

# Sealmaster Material Handling Mounted Ball Bearings

Sealmaster material handling mounted ball bearings feature cast iron housings, an extended inner race insert bearing with ball riding nylon retainer. The insert features a rivet to prevent outer ring rotation and is available with setscrew or SKWEZLOC® concentric locking collar and optional snap on end cover. The contact seal, with black oxide treated flinger provides a good balance between contaminant resistance, grease loss and friction. Depending on your preference, these bearings are available in common unit material handling industry bore sizes and housing configurations as illustrated on the pages to follow.

# Material Handling Mounted Ball Nomenclature Housing Units

## Inserts

\*Note: Configurations are not available in all sizes or housing styles. Consult the product tables and engineering sections for more detail or consult a Bearing Application Engineer.

## Features and Benefits

### Multiple Locking Methods

#### Skwezloc® Concentric Locking Collar

SKWEZLOC is a concentric locking collar clamp design that results in near-perfect concentricity of the shaft to the bearing bore and maintains near-perfect ball path roundness, while reducing fretting corrosion. This design eliminates the shaft damage of setscrew locking, and minimizes bearing induced vibration for smoother quieter operation. The collar has a TORX head cap screw that outlasts stripping 12 times longer than hex head cap screws.

#### Setscrew Locking

120° spaced, balanced three point contact minimizes inner ring distortion vibration, reduces noise, and improves reliability. Precision manufactured diamond faceted setscrews contributes to improved clamping and resistance to back out.

#### Sealing

Positive contact molded nitrile rubber contact seal with an auxiliary flinger element standard. The contact seal allows grease purge and helps keep contamination out of the bearing while the flinger provides a rotating shield that directs contamination away from the seal.

#### Sealed for Life

The Sealmaster Material Handling Bearings are supplied with a plug in the housing to prevent relubrication. A standard lubrication fitting is supplied loose in the box for those customers who prefer relubricating the bearings.

#### End Caps

The Sealmaster Material Handling Bearings housing are machined to accept an optional safety yellow polymer snap on end cap to cover rotating shafts, allowing users to better conform to OSHA requirements for personal protection from rotating shafts. The end cap can easily snap into the housing without the need for special tooling.

## Features and Benefits continued

### Anti-Rotation Rivet

An Anti-rotation rivet prevents outer ring creep, or rotation, within the housing.

### Zone Hardened Inner Race

Sealmaster incorporates a unique heat treat process that hardened the inner race only where it is needed...under the ball path. The zone hardened inner race results in improved lock reliability as a result of less distortion at setscrew location and improved thread conformity resulting in improved clamping and resistance to setscrew back-out.

### Solid Cast Iron Base

Solid bases are standard on Sealmaster Material Handling ball bearing pillow blocks. The solid base provides improved stability, resistance to shock and vibration and prevents frame buckling under base compared to semi-solid and hollow mounting bases.

### Nameplate

Metal nameplate riveted to the housing allows for easy identification even after years of operation.

- Duty:** Standard
- Rolling Elements:** Ball
- Housing:** Cast Iron Pillow Block
- Self Alignment:** +/- 1.5 Degrees
- Lock:** Setscrew
- Seal:** Contact Seal and Flinger
- Temperature:** -20° to 200°F
- Relube:** Plugged, Grease Fitting Included

## Sealmaster Paver Bearings

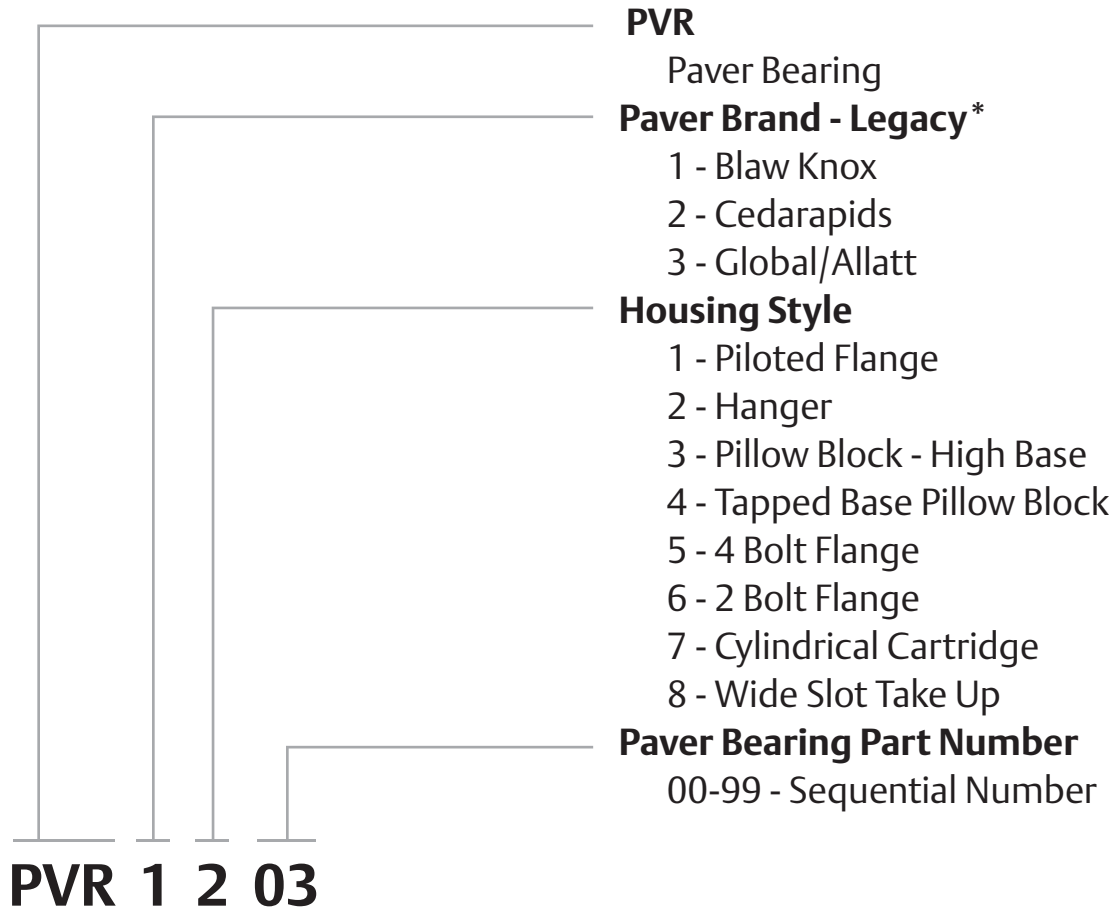

Paver bearings utilize standard Sealmaster features and improved sealing technology to meet the continuing performance needs of industrial paving equipment. Paver bearings were developed by working closely with OEM's in order to provide reliability and uptime for these severe duty applications.

# Paver Bearings Nomenclature

## Features and Benefits

Sealmaster Paver Bearings have been developed in conjunction with original equipment manufacturers and features vary by part number. Some common features are listed below.

### High Temperature Contact Seal

The double lip high temperature contact seal is the most popular design used, some designs incorporate a high temperature single lip contact seal, or combination of different seals for the front and back side of the bearing.

### Nomex\* Seal with Flinger

The Nomex seal provides a high temperature, tight labyrinth seal which retains lubrication and acts as a filter to exclude contamination. The external stamping is a flinger which shields the felt from large contaminants and directs them away from the sealing surface.

### Ductile Iron End Cap

A tough, wear resistant end cap that helps keep asphalt from forcing its way into the bearing. The ductile-iron, bolt-on end cap mates with the casting providing the first barrier against abrasive asphalt.

### Rotating Shield

The black oxidized shield is fixed to the extended inner ring and precision machined to run with a small clearance with the end cap. The shield resists asphalt erosion and helps protect the inner sealing elements.

### Self-Adjusting Washer

A conical-shaped mechanical seal is located directly behind the rotating shield supplying the bearing with a third contamination barrier. The stainless steel washer attaches to the bearing's inner ring.

## Browning Mounted Ball Bearings

Browning mounted ball bearings feature multiple housing styles, materials and configurations, an extended inner race insert bearing with ball riding nylon retainer. The insert features a rivet to prevent outer ring rotation and is available with setscrew, eccentric, or BOA concentric locking collar. The contact seal, with black oxide treated flinger provides a good balance between contaminant resistance, grease loss and friction. Depending on your preference, these bearings are available in inch and metric bore with a wide variety of cast iron, stamped steel or rubber mount housings or specific industry solutions as illustrated on the pages to follow.

# Browning Mounted Ball Nomenclature Housing Units

Housing	Housing Style	Material
RUBR	Grommet	Rubber
SSF2	Two Bolt Flange	Stamped Steel
SSF3	Three Bolt Flange	Stamped Steel
SSF3T	Three Bolt Flange	Stamped Steel
SSF4	Four Bolt Flange	Stamped Steel
SSP	Pillow Block	Stamped Steel
SSRP	Pillow Block	Stamped Steel / Rubber
VF2	Two Bolt Flange	Cast Iron
VF3	Three Bolt Flange	Cast Iron
VF4	Four Bolt Flange	Cast Iron
VFB	Flange Bracket	Cast Iron
VFC	Piloted Flange Cartridge	Cast Iron
VP	Pillow Block - High Base	Cast Iron
VPD	Pillow Block - Alternate Base	Cast Iron
VPL	Pillow Block - Low Base	Cast Iron
VTB	Tapped Base Pillow Block	Cast Iron
VTW	Wide Slot Take Up	Cast Iron

\*Note: Configurations are not available in all sizes or housing styles. Consult the product tables, option sections and engineering sections for more detail or consult a Bearing Application Engineer.

# Browning Mounted Ball Nomenclature Inserts

## Prefix

- V - Spherical O.D. Bearing Insert
- L - Spherical O.D. Bearing Insert - No Relube
- LR - Spherical O.D. Bearing Insert - No Relube
- LRS - Spherical O.D. Bearing Insert - No Relube
- SL - Cylindrical O.D. Bearing Insert - No Relube

## Locking Option

- B - BOA Concentric
- E - Eccentric
- S - Setscrew

## Insert Duty

- Omit for Metric
- 1 - Light or Intermediate Duty / 100 Series
- 2 - Standard Duty / 200 Series
- 3 - Medium Duty / 300 Series

## Bore Size

- Inch - ##/16 (ex. 20/16 = 1 1/4")
- S for 1 1/4" and 2" Reduced
- Metric - ex. 25 MM

## Options

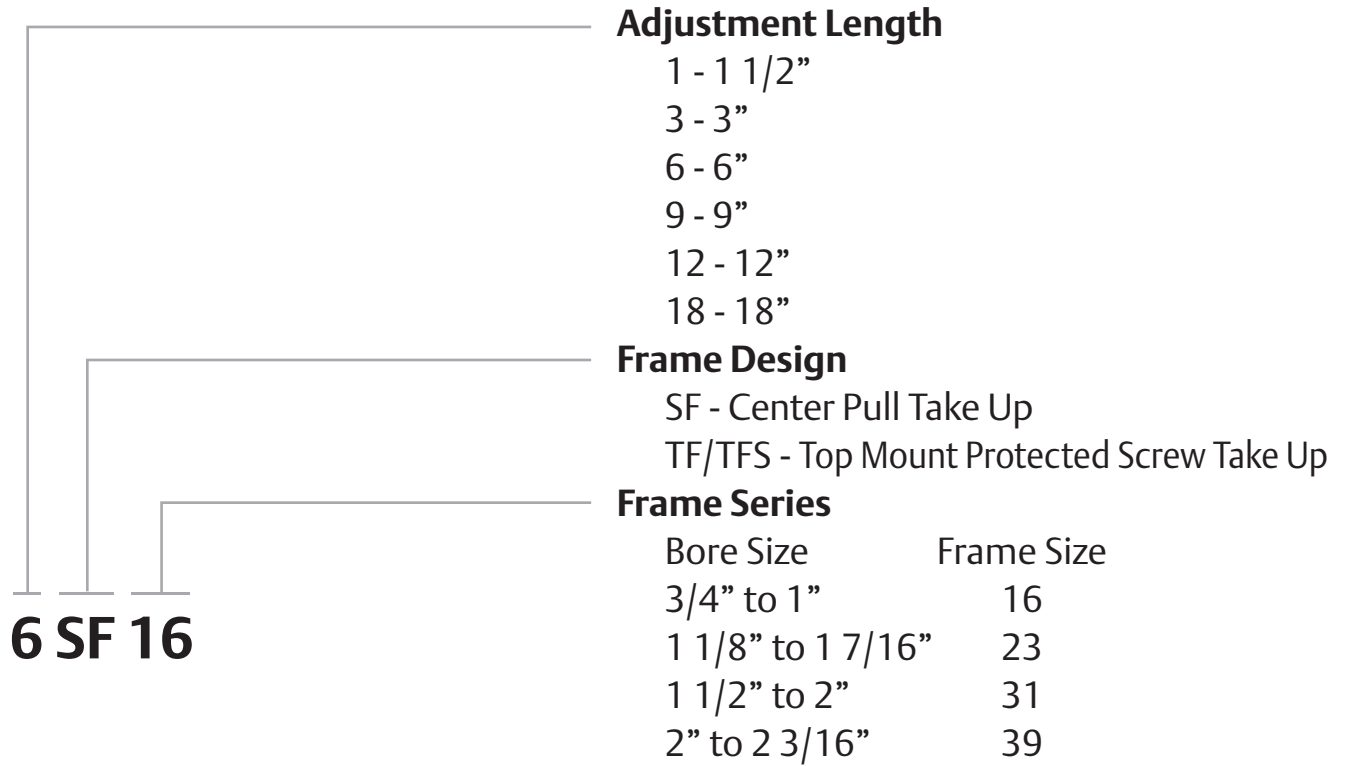

- SK### - Special Design

\*Note: Configurations are not available in all sizes or housing styles. Consult the product tables, option sections and engineering sections for more detail or consult a Bearing Application Engineer.

# Browning Mounted Ball Nomenclature Take Up Frame

## Features and Benefits

### Multiple Methods Locking

#### Setscrew Locking

120° spaced, balanced three point contact minimizes inner ring distortion vibration, reduces noise, and improves reliability. Precision manufactured diamond faceted setscrews contribute to improved clamping and resistance to back out.

#### BOA Concentric

BOA is a concentric locking collar clamp design that results in near-perfect concentricity of the shaft to the bearing bore and maintains near perfect ball path roundness, while reducing fretting corrosion. This design eliminates the shaft damage of setscrew locking, and minimizes bearing induced vibration for smoother quieter operation. The collar has a TORX head cap screw that outlasts stripping 12 times longer than hex head cap screws.

#### Eccentric Locking

Eccentric locking design incorporates a precision eccentric collar to mate with the inner ring extension for shaft hold.

Note: The eccentric is designed for single direction of rotation and should not be used when two direction rotation is present.

#### Sealing

Positive contact molded nitrile rubber contact seal with an auxiliary flinger element standard. The contact seal allows grease purge and helps keep contamination out of the bearing while the flinger provides a rotating shield that helps direct contamination away from the seal.

#### Anti-Rotation Rivet

An anti-rotation rivet prevents outer ring creep, or rotation, within the housing.

## Features and Benefits continued

### Semi-Solid Cast Iron Base

The rugged base design provides an excellent mounting foundation. This is integral to prevent sheet metal “buckling”

### Zone Hardening Inner Race

Browning incorporates a unique heat treat process that hardens the inner race only where it is needed...under the ball path. The zone hardened inner race results in improved lock reliability as a result of less distortion at setscrew location and improved thread conformity resulting in improved clamping and resistance to setscrew back-out.

### Identification Marking

Browning cast iron housing bearing units have a sticker with part description and brand washer under the lubrication fitting. This allows for easy verification of the part number during installation and for replacement.

## Air Handling “AH” Option

The Browning Air Handling mounted ball bearing has the same features as the standard Browning mounted ball bearing expect for the following air handling features.

### AH Housing Fit

Air Handling “AH” ball bearings are manufactured with a controlled housing fit that allows the bearing to properly self-align when mounted on lightweight frames commonly found on air handling equipment.

### Noise Test

All Air Handling “AH” bearings must pass a two stage noise testing verification for quiet operation to meet the noise level standards of the air handling industry.

Popular shaft sizes and housing configurations in the normal and medium duty series are available “off-the-shelf” these air handling features (designated by the AH suffix). These products are offered in both setscrew and BOA concentric locking.

## Browning VER Style Ball Bearings

Browning VER bearings feature black oxide treated inner and outer rings, and extended inner race bearing with ball riding nylon retainer. Shaft lock is achieved by 120° spaced diamond faceted setscrew locking. The contact seal, with black oxide treated flinger provides a good balance between contaminant resistance, grease loss and friction.

## Browning VER Style Ball Nomenclature

# Browning<sup>®</sup> Cylindrical OD Insert Bearings

## Features and Benefits

### Setscrew Locking

120° spaced, balanced three point contact minimizes inner ring distortion vibration, reduces noise, and improves reliability. Precision manufactured diamond faceted setscrews contribute to improved clamping and resistance to back out.

### Sealing

Positive contact molded nitrile rubber contact seal with an auxiliary flinger element standard. The contact seal allows grease purge and helps keep contamination out of the bearing while the flinger provides a rotating shield that directs contamination away from the seal.

### Zone Hardened Inner Race

Browning incorporates a unique heat treat process that hardens the inner race only where it is needed...under the ball path. The zone hardened inner race results in improved lock reliability as a result of less distortion at setscrew location and improved thread conformity resulting in improved clamping and resistance to setscrew back-out.

### Identification Marking

Browning VER bearings have the part number laser marked on the inner ring for easy verification of the part number during installation and for replacement.

# Load Ratings and Life

## Life Calculations

The L10 (rating) life for any given application and bearing selection can be calculated in terms of millions of revolutions by using the bearing Basic Dynamic Rating and applied radial load (or, equivalent radial load in the case of radial bearing applications having combined radial and thrust loads). The L10 life for any given application can be calculated in terms of hours, using the bearing Basic Dynamic Rating, applied load (or equivalent radial load) and suitable speed factors, by the following equation:

$$L_{10} = \left(\frac{C}{P}\right)^3 \times \frac{1,000,000}{60 \times n} = \left(\frac{C}{P}\right)^3 \times \frac{16667}{n}$$

Where:

$L_{10}$  = The # of hours that 90% of identical bearings under ideal conditions will operate at a specific speed and condition before fatigue is expected to occur.

$C$  = Basic Dynamic Rating (lbs)  
1,000,000 Revolutions

$P$  = Constant Equivalent Radial Load (lbs)

$n$  = Speed (RPM)

Additionally, the ABMA provides application factors for all types of bearings which need to be considered to determine an adjusted Rated Life ( $L_{na}$ ). L10 life rating is based on laboratory conditions yet other factors are encountered in actual bearing application that will reduce bearing life.  $L_{na}$  life rating takes into account reliability factors, material type, and operating conditions.

$$L_{na} = a_1 \times a_2 \times a_3 \times L_{10}$$

Where:

$L_{na}$  = Adjusted Rated Life.

$a_1$  = Reliability Factor. Adjustment factor applied where estimated fatigue life is based on reliability other than 90% (See Table 1).

**Table 1 Life Adjustment Factor for Reliability**

Reliability %	$L_{na}$	$a_1$
90	L10	1
95	L5	0.62
96	L4	0.53
97	L3	0.44
98	L2	0.33
99	L1	0.21
50	L50	5

$a_2$  = Material Factor. Life adjustment for bearing race material. Regal Power Transmission Solutions bearing races are manufactured from bearing quality steel. Therefore the  $a_2$  factor is 1.0.

$a_3$  = Life Adjustment Factor for Operating Conditions. This factor should take into account the adequacy of lubricant, presence of foreign matter, conditions causing changes in material properties, and unusual loading or mounting conditions. Assuming a properly selected and mounted bearing having adequate seals and lubricant operating below 250°F and tight fitted to the shaft, the  $a_3$  factor should be 1.0.

Mounted bearings are typically “slip fitted” to the shaft and rely on design features such as the inner race length and locking device for support. ABMA recommends an  $a_3$  factor of .456 for “slip fit” ball bearings. See sample calculations on page G-224.

Vibration and shock loading can act as an additional loading to the steady expected applied load. When shock or vibration is present, an  $a_3$  Life Adjustment Factor can be applied. Shock loading has many variables which often are not easily determined. When shock or vibration is present, the following  $a_3$  Life Adjustment Factors are recommended. The shock factor is used in combination with the “slip fit” factor.

The  $a_3$  factor takes into account a wide range of application and mounting conditions as well as bearing features and design. Accurate determination of this factor is normally achieved through testing and in-field experience. Regal Power Transmission Solutions offers a wide range of options which can maximize bearing performance. Consult Application Engineering for more information. See sample calculations on page G-224.

**Table 2 Shock/Vibration Factor**

Type	$a_3$ Factor
Steady Loading	1.0
Light Shock/Vibration	.5
Moderate Shock/Vibration	.3

# Load Ratings and Life Continued

## Combined Load - Ball Bearings

For applications where a combination of both radial and thrust loads are applied to the bearing the equivalent radial load must be calculated and applied to the L10 life formula.

1. Use Table 3 (below) and Table 4 (page G-228) to identify the relative axial load factor (ND2).
2. Determine the relative axial load (RAL):

$$RAL = \frac{F_a}{ND^2} \text{ - applied thrust load}$$

**ND<sup>2</sup> - relative axial load factor**

3. Match the nearest relative axial load value in Table 3 to the corresponding “e” value. For precise calculation, linearly interpolate the values for “e” for your exact relative axial load value.

**Table 3 Equivalent Load Calculation Data - Ball Bearings**

Relative Axial Load	e	Fa / Fr ≤ e		Fa / Fr > e	
		x	y	x	y
24.92	0.19	1	0	0.56	2.30
50.03	0.22				1.99
99.91	0.26				1.71
149.35	0.28				1.55
200.10	0.30				1.45
300.15	0.34				1.31
500.25	0.38				1.15
749.65	0.42				1.04
999.05	0.44				1.00

4. Calculate Fa/Fr and compare value to the “e” value found in step #3 above.
5. Choose values for “X” and “Y” based on step #3 & 4 and from Table 3. Linear interpolation is recommended for exact calculations.
6. Calculate equivalent radial load using the following equation:  

$$P = XFr + YFa$$
7. Calculate the adjusted life (Lna) using the life calculation formula above.

## Variable Load Formula

Root mean load (RML) is to be used when a number of varying loads are applied to a bearing for varying time limits. Maximum loading still must be considered for bearing size selection.

$$RML^* = \sqrt[3]{\frac{(L_1^3 N_1) + (L_2^3 N_2) + (L_3^3 N_3)}{100}}$$

Where:

RML = Root Mean Load (lbs.)

L<sub>1</sub>, L<sub>2</sub>, etc. = Load in pounds

N<sub>1</sub>, N<sub>2</sub>, etc. = Percent of total time operated at loads L<sub>1</sub>, L<sub>2</sub>, etc.

\*Apply RML to rating at mean speed to determine resultant life.

## Mean Speed Formula

The following formula is to be used when operating speed varies over time.

$$\text{Mean Speed} = \frac{S_1 N_1 + S_2 N_2 + S_3 N_3}{100}$$

S<sub>1</sub>, S<sub>2</sub>, etc = Speeds in RPM

N<sub>1</sub>, N<sub>2</sub>, etc = Percentage of total time operated at speeds S<sub>1</sub>, S<sub>2</sub>, etc

## High Load Applications

Applications where the loading approaches the load listed in the rating tables on pages G-230 to G-233 at 5000 hours life and 150/250 RPM, should be reviewed and given special consideration.

Modifications to consider Include:

- Shafting size should be closely controlled for a line to line to a light press fit.
- Skwezloc® Locking Collar or double lock is the preferred lock.
- Lubricants with “EP” extreme pressure additives may be required.
- Care in housing selection, load direction, and mounting techniques should be exercise

# Load Ratings and Life Continued

## High Speed Applications

Applications where the speed is in the range of 80-100% of the maximum speeds listed in the rating tables on pages G-230 to G-233, should be reviewed and given special consideration.

Modifications to consider include:

- Shaft size should be controlled to specifications listed in the installation section. See tables above.
- SKWEZLOC Locking Collar and double lock are the preferred lock systems for high speed applications.
- High quality lubricants should be used.
- Grease should be added more frequently and in small amounts. See Page G-254.
- Care in mounting techniques should be exercised. See Page G-246 to G-253.

## Bearing Life In Oscillating Applications

The equivalent rotative speed (ERS) is used in life calculations when the bearing does not make complete revolutions during operation. The ERS is then used as the bearing operating speed in the calculation of the L10 (Rating) Life. The formula is based on sufficient angular rotation to have roller paths overlap.

**ERS = Equivalent Rotative Speed**

**N = Total number of degrees per minute through which the bearing will rotate.**

$$ERS = \frac{N}{360}$$

In the above formula, allowance is made for the total number of stress applications on the weakest race per unit time, which, in turn, determines fatigue life and the speed factors. The theory behind fretting corrosion is best explained by the fact that the rolling elements in small angles of oscillation retrace a path over an unchanging area of the inner or outer races where the lubricant is prevented by inertia from flowing in behind the roller as the bearing oscillates in one direction. Upon reversal, this small area of rolling contact is traversed by the same roller in the dry state. The friction of the two unlubricated surfaces causes fretting corrosion and produces failures which are unpredictable from a normal life standpoint.

With a given bearing selected for an oscillating application, the best lubrication means is a light mineral oil under positive flow conditions. With a light oil, there is a tendency for all areas in the bearing load zone to be immersed in lubricant at all times. The full flow lubrication dictates that any oxidized material which may form is immediately carried away by the lubricant, and since these oxides are abrasive, further wear tends to be avoided. If grease lubrication must be used, it is best to consult with either the bearing manufacturer or the lubricant manufacturer to determine the best possible type of lubricant. Greases have been compounded to resist the detrimental effect of fretting corrosion for such applications.

## Static Load Rating

The “static load rating” for rolling element bearings is that uniformly distributed static radial load acting on a non-rotating bearing, which produces a contact stress of 580,000 psi at the center of the most heavily loaded rolling element. At this stress level, plastic deformation begins to be significant. Experience has shown that the plastic deformation at this stress level can be tolerated in most bearing applications without impairment of subsequent bearing operation. In certain applications where subsequent rotation of the bearing is slow and where smoothness and friction requirements are not too exacting, a higher static load limit can be tolerated. Where extreme smoothness is required or friction requirements are critical, a lower static load limit may be necessary.

## Minimum Bearing Load

Skidding, or sliding, of the rolling elements on the raceway instead of a true rolling motion can cause excessive wear. Applications with high speeds and light loading are particularly prone to skidding. As a general guideline, rolling element bearings should be radially loaded at least 1% of Basic Dynamic Rating for ball bearings. For applications where load is light relative to the bearings dynamic load rating, consult Application Engineering for assistance.

# Load Ratings and Life Continued

## Computing Bearing Loads

In the computation of bearing loads in any application of a Regal Power Transmission Solutions unit, the principal factor determining the selection of the unit is the equivalent radial load to which the bearing will be subjected. These radial loads result from any one or any combination of the following sources:

1. Weights of machine parts supported by bearings.
2. Tension due to belt or chain pull.
3. Centrifugal force from out of balance, eccentric or cam action.

The resulting load from any one, or any combination of the above sources is further determined by knowing:

1. The magnitude of the load.
2. Direction of the load.
3. The point of load application.
4. The distance between bearing centers.

Bearing loads are the result of force acting on the shaft. Direction, magnitude, and location with respect to the bearings must be considered when calculating bearing loads. The following cases are typical examples of loads encountered and methods of calculating bearing loads.

**CASE #1**  
**Drive Load Calculation**

$$P = \frac{126,000 \times \text{HP}}{\text{RPM} \times d} \times K$$

= Apply P to Case 2, 3 or 4 if applicable

HP = horsepower  
RPM = revolutions per minute  
d = pitch of pulley in inches  
K = constant for type of drive used  
K = 1.5 for V-belts  
K = 2 to 3 for flat transmission belts  
K = 1.1 for chain drives

**CASE #2**  
**Cantilever and Drive**

$$\text{Load on Bearing A} = \frac{P_1 \times (a + k) - (P_2 \times b)}{k}$$

$$= \frac{200 \times (4 + 9) - (80 \times 2)}{9}$$

$$= 271 \text{ lbs.}$$

$$\text{Load on Bearing B} = \frac{P_2 \times (k + b) - (P_1 \times a)}{k}$$

$$= \frac{80 \times (9 + 2) - (200 \times 4)}{9}$$

$$= 9 \text{ lbs.}$$

**CASE #3**  
**Straddle, Cantilever Drive**

$$\text{Load on Bearing A} = \frac{P_1 \times (k + a) + (P_2 \times c) - (P_3 \times d)}{k}$$

$$= \frac{60 \times (12 + 2) + (180 \times 6) - (70 \times 4)}{12}$$

$$= 137 \text{ lbs.}$$

$$\text{Load on Bearing B} = \frac{-(P_1 \times a) + (P_2 \times b) + P_3 \times (k + d)}{k}$$

$$= \frac{-(60 \times 2) + (180 \times 6) + 70 \times (12 + 4)}{12}$$

$$= 173 \text{ lbs.}$$

**CASE #4**  
**Straddle Mount, Cantilever Drive**

$$\text{Load on Bearing A} = \frac{(P_1 \times b) - (P_2 \times c)}{k}$$

$$= \frac{(1000 \times 4) - (150 \times 3)}{11}$$

$$= 323 \text{ lbs.}$$

$$\text{Load on Bearing B} = \frac{(P_1 \times a) + (c + k) \times (P_2)}{k}$$

$$= \frac{(1000 \times 7) + (3 + 11) \times (150)}{11}$$

$$= 827 \text{ lbs.}$$

**CASE #5**  
**Vibrating Drives**

Load due to Centrifugal and Inertial Forces - In a shaker or gyrating screen bearing application, the load on the bearings is increased by sudden stopping, starting, and reversing of typically large loads. This can be expressed as a basic physical law:

**Force = Mass x Accelerations**

In order to use this law, we develop from it the following equation:

$$F = .000341 \times WR(\text{RPM})^2$$

Where: F = Load of force in lbs.  
W = Weight of rotating mass in lbs.  
R = Radius of rotation or throw in feet  
RPM = Shaft rotation in revolutions per minute

What is the centrifugal bearing load on a shaker screen which weighs 2,500 lbs., has a throw of 1/4 in. and whose shaft speed is 500 RPM?

$$F = .000341 \times 2,500 \times \frac{.250}{12} \times (500)^2 = 4,440 \text{ lbs.}$$

# Load Ratings and Life Continued

## Mounted Ball Bearing Selection - New Applications:

Using variations of the life formulas and application information, it is possible to select bearings based on desired life, load applied, and shaft speed. **This method can only be applied where axial load is less than or equal to 1/2 the radial load.**

1. Determine required application hours ( $L_{na}$ ).
2. Calculate  $L_{10}$  using adjustment factors:

$$L_{10} = \frac{L_a}{a_1 \times a_2 \times a_3}$$

3. Calculate Basic Dynamic Radial Rating ( $C_{req}$ ).

$$C_{req} = P \times \left( \frac{L_{10} \times N}{16,667} \right)^{1/3}$$

$P$  = Constant Equivalent Radial Load (lbs)  
 $N$  = Speed (RPM)

4. Use Table No. 4 and 5 on page G-227 to G-229, find a basic Dynamic Radial Rating Value greater than or equal to  $C_{req}$  calculated in step # 3.

5. Select any bearing from the row in step # 4 or larger. If  $C_{req}$  is greater than the largest Basic Dynamic Radial Rating Value of Table No. 4 or 5, go to the Mounted Roller Bearing Section H and I.

6. If Ball bearing is selected, proceed with housing, seal, and lock selection.

Typical operating temperature range for standard bearings is -20° to 200° F for Browning and -20°F to 220°F for Sealmaster Gold. For operating temperatures outside this range, contact Application Engineering. For Maximum speed information, see tables on pages G-235 and G-243

## Application Examples:

### Example #1 - Pure Radial Load

#### Question #1:

What is the adjusted bearing life ( $L_{na}$  hours) for an NP-39 Sealmaster Ball Bearing with no shock conditions and the following application criteria?

Design Load ( $P$ ) = 1300 lbs.  
 Speed ( $n$ ) = 1000 RPM  
 Shaft Size = 2 7/16 in.  
 Operating Temp. = 125°F

#### Solution:

1. Begin with the  $L_{10}$  life formula:

$$L_{10} = (C/P)^3 \times \frac{16667}{n}$$

Look up the insert of an NP-39 on page G-31. From Table No. 4 on page G-228, the Basic Dynamic Radial Rating is 11,789 lbs.

$$L_{10} = \left( \frac{11789}{1300} \right)^3 \times \frac{16667}{1000} = 12,430 \text{ hours}$$

2. Apply the life adjustment factors:

$L_{na}$  hours =  $L_{10} \times a_1 \times a_2 \times a_3$   
 $L_{na}$  hours = 12,430 x 1 x 1 x 0.456  
 $L_{na}$  hours = 5,700 hours

# Load Ratings and Life Continued

**Question #2:**

What is the adjusted bearing life (L10 hours) for an NP-39 Sealmaster Ball Bearing with moderate shock conditions and the same applications criteria from above?

**Solution:**

1. From Table 2 on page G-221:

$$a_3 = 0.5 \times 0.456$$

2. Re-Apply the life adjustment factors to the previously calculated L<sub>10</sub> life:

$$\begin{aligned} L_{na} \text{ hours} &= L_{10} \times a_1 \times a_2 \times a_3 \\ L_{na} \text{ hours} &= 12,430 \times 1 \times 1 \times (0.5 \times 0.456) \\ L_{na} \text{ hours} &= 2,830 \text{ hours} \end{aligned}$$

**Example #2 - Combined Radial and Thrust Load**

**Question #1:**

What is the adjusted bearing life (L<sub>na</sub> hours) for an NP-39 Sealmaster Ball Bearing with no shock conditions and the following application criteria?

- Design Radial Load (F<sub>r</sub>) = 500 lbs.
- Design Thrust Load (F<sub>a</sub>) = 1000 lbs.
- Speed (n) = 1000 RPM
- Shaft Size = 2 7/16 in.
- Operating Temperature = 125°F

**Solution:**

1. Calculate F<sub>a</sub>/F<sub>r</sub> = 1000/500 = 2
2. Look up the insert of an NP-39 on page G-31. From Table 4 on page G-228, ND<sup>2</sup> is 3.969 lbs and Basic Dynamic Rating is 11,789 lbs.
3. Begin by calculating the Relative Axial Load (RAL):

$$RAL = \frac{F_a}{ND^2} = \frac{1000}{3.9690} = 251 \text{ lbs.}$$

4. From Table 3 on page G-222, interpolate RAL between 200.10 and 300.15 and “e” between 0.30 and 0.34 to obtain “e” value:

$$\frac{251 - 200.10}{300.15 - 200.10} = \frac{e - 0.30}{0.34 - 0.30}$$

Therefore e = .32

5. From Table 3 on page G-222, determine the value of “X” and “Y” through interpolation. Interpolate “e” between 0.30 and 0.34 and “Y” between 1.45 and 1.31 because F<sub>a</sub>/F<sub>r</sub> > e

$$\frac{0.32 - 0.30}{0.34 - 0.30} = \frac{Y - 1.45}{1.31 - 1.45}$$

Therefore Y = 1.38 and X = .56

6. Determine the equivalent radial load (P)

$$\begin{aligned} P &= (X F_r) + (Y F_a) \\ &= (0.56 \times 500) + (1.38 \times 1000) = 1660 \text{ lbs.} \\ L_{10} &= (C/P)^3 \times \frac{16667}{n} \end{aligned}$$

Look up the insert of an NP-39 on page G-31. From Table 4 on page G-228, the Basic Dynamic Rating is 11,789 lbs.

$$L_{na} = .456 \times \left( \frac{11789}{1660} \right)^3 \times \frac{16667}{1000} = 2722 \text{ hours}$$

Setscrew locking standard duty, ER cylindrical O.D., Material Handling and Medium Duty bearing are shown.  
 For Skwezloc and Double Setscrew Locking use the equivalent setscrew lock rating in the table. Example: 2-1, 2-1D and 2-1T all use the 2-015 series rating  
 For RB inserts use the equivalent ER series bearing listed to determine the capacity. Ex: RB-16, use ER-16

Setscrew locking 100, 200, 300 series and VER's shown.

For VE-100, RUBRE-100, RUBRS-100, SLS-100, LE-100, LR-100, LRS-100, LS-100 use equivalent ratings and factors for respective 100 series bore.

For VB-200, VE-200 equivalent ratings and factors for respective 200 series bore.

For VB-300 equivalent ratings and factors for respective 300 series bore.

# Load and Speed

- Table 6 displays the Sealmaster Gold and Material Handling ball bearing load capacities for a given L10 life, speed and shaft size.
- Values in Table 6 represent radial loads at ideal conditions with press fit mounting to the shaft. ABMA recommends de-rating of slip fit mounted bearings. Elevated operating temperatures can reduce the load capacity of bearing steel where a material de-rating is also recommended.
  - For operating temperatures up to 200°F, divide the value in the load table by 1.3 to obtain the slip fit derated value.
  - For units designed for operating temperatures 200°F to 400°F, divide the value in the load table by 1.5 to obtain the slip fit/elevated temperature de-rate value.
  - Values in Table 6 represent equivalent radial loads only. For combined radial/thrust loads see page G-222.
- The gray shaded area indicates the maximum speed ratings for Skwezloc concentric locking collar and double setscrew lock bearings (applicable on sizes available). All speeds listed are for the standard felt seal. For speed ratings using alternate seals, see pages G-235 to G-240.
- The double line indicates the maximum speed ratings of material handling bearings.
- The blue shaded area represents maximum recommended load for given operating speed based on load of 25% BDR. It is NOT recommended to exceed these loads in general industrial applications. See note on page G-222 for high load applications.
- Areas designated by “-” exceed maximum value for standard bearings. See note on page G-223.
- Consult Application Engineering for load and speed applications not covered in this table.

How to Read the Table

Example A: For a 1" standard duty ball bearing operating at 1000 RPM and desired 100,000 hours L10 life, 154 Lbs is the maximum allowable radial load.  
 Example B: If 230 lbs of radial load is applied to a 1" standard duty shaft operating at 1000 RPM, the resulting L10 life is 30,000 hours.

See notes on top of page G-230.

How to Read the Table

Example A: For a 1" standard duty ball bearing operating at 1000 RPM and desired 100,000 hours L10 life, 154 Lbs is the maximum allowable radial load.

Example B: If 230 lbs of radial load is applied to a 1" standard duty shaft operating at 1000 RPM, the resulting L10 life is 30,000 hours.

# Load and Speed continued

1. Table 7 displays the Browning 200 (VS-200) and 300 (VS-300) Series ball bearing load capacities for a given L10 life, speed and shaft size. For VB-200 and VE-200 use equivalent ratings for respective 200 series bore. For VB-300 use equivalent ratings for respective 300 series bore.

2. Values in Table 7 represent radial loads at ideal conditions with press fit mounting to the shaft. ABMA recommends de-rating of slip fit mounted bearings. Elevated operating temperatures can reduce the load capacity of bearing steel where a material de-rating is also recommended.

- a. For operating temperatures up to 200°F, divide the value in the load table by 1.3 to obtain the slip fit derated value.
- b. For units designed for operating temperatures 200°F to 400°F, divide the value in the load table by 1.5 to obtain the slip fit/ elevated temperature de-rate value.
- c. Values in Table 7 represent equivalent radial loads only. For combined radial/thrust loads see page G-222.

3. The blue shaded area represents maximum recommended load for given operating speed based on load of 25% BDR. It is NOT recommended to exceed these loads in general industrial applications. See note on page G-222 for high load applications.

4. Areas designated by “-” exceed maximum value for standard bearings. See note on page G-223.

5. Consult Application Engineering for load and speed applications not covered in this table.

# Load and Speed continued

1. Table 8 displays the Browning 100 setscrew locking ball bearing (VS-100) load capacities for a given L10 life, speed and shaft size. For VE-100, RUBRE-100, RUBRS-100, SLS-100, LE-100, LR-100, LRS-100, LS-100 use equivalent ratings for respective 100 series bore.

2. Values in Table 8 represent radial loads at ideal conditions with press fit mounting to the shaft. ABMA recommends de-rating of slip fit mounted bearings. Elevated operating temperatures can reduce the load capacity of bearing steel where a material de-rating is also recommended.

- a. For operating temperatures up to 200°F, divide the value in the load table by 1.3 to obtain the slip fit derated value.
- b. For units designed for operating temperatures 200°F to 400°F, divide the value in the load table by 1.5 to obtain the slip fit/ elevated temperature de-rate value.
- c. Values in Table 8 represent equivalent radial loads only. For combined radial/thrust loads see page G-222.

3. The **blue shaded area** represents maximum recommended load for given operating speed based on load of 17% BDR. It is NOT recommended to exceed these loads in general industrial applications. See note on page G-222 for high load applications.

4. Areas designated by “-” exceed maximum value for standard bearings. See note on page G-223.

5. Consult Application Engineering for load and speed applications not covered in this table.

How to Read the Table

Example A: For a 1" standard duty ball bearing operating at 1000 RPM and desired 100,000 hours L10 life, 154 Lbs is the maximum allowable radial load.

Example B: If 230 lbs of radial load is applied to a 1" standard duty shaft operating at 1000 RPM, the resulting L10 life is 30,000 hours.

**Mounted Ball Bearing Engineering see page G-220.**

For more information on bearing capabilities outside of our standard offering, please contact Application Engineering (800) 626-2093.

### Ball Bearing Maximum Speed Rating Tables

Tables 9-13 display the maximum speed rating for various ball bearing seals and locking devices. Values in the table represent speeds at ideal conditions. Other application factors may reduce the speed rating of a bearing.

#### Table 9 – Sealmaster Gold Standard Duty Maximum Speed Rating

If seal max speed in this chart exceeds bearing max speed from rating tables or speed that is deemed acceptable for the application, lowest applicable speed applies.

\*2-215 series uses a double lip seal vs. our triple lip high performance seal (HPS).

1 15/16	49.2	VS-331	2500
2 3/16	55.6	VS-335	

For VB-300 equivalent limits for respective 300 series bore.

## Lock Types

### “Slip Fit” Mounting

Mounted Ball Bearings are designed to slip fit onto the shaft. Slip fit means that the shaft is usually slightly smaller, and the inner ring bore is slightly larger than the nominal shaft sizes listed in the bearing tables. Slip fit mounting is very popular and economical as it does not require specialized equipment or tooling to mount the bearing on the shaft. Reliability of the lock is still dependent on the proper mounting techniques and proper shaft size control.

### Shaft Locking System Selection

Selection of the shaft locking system may be dependent on some or all of the following application criteria:

- Lock Reliability
- Shaft Run-Out
- Vibrating Systems
- Vibration Reduction (Isolation Devices)
- Shaft Fretting
- Distress On The Shaft Surface
- Shafting Material
- Space On The Shaft
- Shaft Orientation (Vertical, Horizontal)
- Ease Of Installation

### Single Sided (Single Lock) Setscrew Locking System

Single sided setscrew lock has an extended inner ring on one side of the bearing. This locking system is held to the shaft by two setscrews. Single lock is the most popular bearing mounting method for Mounted

Ball Bearings. It is easy to mount because it requires tightening only two setscrews and takes up minimal space along the shaft. Sealmaster and Browning Mounted Ball Bearings have a unique package of features including: wide inner ring design, zone hardened inner rings, specially designed setscrews and 120° setscrew position. These features are unmatched in the mounted bearing industry and are designed to maximize lock reliability.

Single lock setscrew design is specified in a wide range of applications for moderate loads and speeds. This lock is sometimes specified in flange block and cartridge housings because of inaccessibility of back side setscrews. Upset setscrew marks on the shaft can be minimized for removal of the bearing by removing the setscrews and using a flat punch, tapping the upset shaft material flat onto the shaft. For high speed, heavy load (radial or thrust), vibration, eccentric loading, stainless steel or hollow shafting, reduction of fretting, vibration or marking of the shafting, review alternate locks below or consult Application Engineering.

### Double Sided (Double Lock) Setscrew Locking System

Double sided setscrew lock is extended on both sides of the inner ring. The inner race is locked to the shaft by four screws. This design is the preferred lock for the heavy duty Sealmaster Gold Mounted Ball Bearings with double lock incorporate the same unique package of locking features included in the single lock design: wide inner ring design, zone hardened inner rings, specially designed setscrews, and 120° setscrew position.

The double lock design is specified for demanding applications or where shaft lock reliability is critical. This design is often specified on high load applications, high thrust load applications, vertical shafts where extra holding power is required, eccentric drive applications, high vibration applications, and high speed applications. It also helps to reduce fretting corrosion on the shaft. Upset setscrew marks on the shaft can be minimized for removal of the bearing by removing the setscrews and, using a flat punch, tapping the upset shaft material flat onto the shaft. For stainless steel shafting, or where vibration reduction is required, refer to Skwezloc<sup>®</sup> or BOA Concentric locking collar below or consult Application Engineering.

### Eccentric Locking

Eccentric locking design incorporates a precision eccentric collar that mates with the inner ring extension for shaft hold. The inner ring is extended and has an eccentric profile machined on the outer diameter at the end. The inner diameter of the collar has an eccentric profile machined that mates with the inner ring extension. The eccentric collar is placed on the inner ring extension and rotated in the direction of shaft rotation. This rotation forces the collar and inner ring eccentric profiles to lock by creating a friction grip. The collar makes contact with the shaft and a setscrew on the collar is then tightened to lock the collar in place. This design is available on Browning Mounted Ball Bearings only.

Note: The eccentric is designed for single direction of rotation and should not be used when two direction rotation is present.

# Lock Types continued

## The Concentric Locking System

Sealmaster Skwezloc® and Browning BOA concentric locking system for ball bearings has an inner ring extension which is slit into 6 tangs. The split concentric collar is tightened over the inner ring extension, gripping the bearing to the shaft. The concentric design friction grips to the shaft with 360° of holding.

- Centers the shaft in the bore of the bearing, reducing vibration and shaft runout.
- Maintains manufactured ball path roundness reducing vibration and enhances bearing life.
- Excellent for high speed applications
- Does not mark the shaft like set screw or eccentric lock.
- Is easy to install, requiring tightening only one Torx head capscrew.

Concentric is often specified in air handling, HVAC, fan and blower applications where noise and vibration reduction is essential. High speed applications such as saws and routers or high speed spindles are common applications for concentric locking. Coating roll and sanding applications are also good applications for the concentric where runout control of the rotating system is essential. Concentric is recommended for stainless steel or hardened shafting. In vertical shaft or high thrust load applications, a thrust collar or axial locating device is required to insure safety of the friction grip lock.

 \* Review use of thrust device.

Note: Premium locking systems are not intended to be a fix for worn, damaged or undersized shafting or poor mounting practices. Consult Installation Instructions for proper installation.

## Sealmaster Gold Mounted Ball Bearing Housed Units Installation

### NOTICE

- These bearings are designed for maximum permissible static misalignment of  $\pm 2$  degrees. Installation, handling or operation of the bearing in excess of the maximum of  $\pm 2$  degrees can cause reduction in bearing performance and may lead to equipment failure.

- Do not strike or hammer on any component of the bearing and/or shaft. Impact can result in damage to the bearing that may cause reduction in bearing performance and may lead to equipment failure.

### Step 1: Inspect Shaft and Bore

Shaft should be within tolerance range shown in table, clean and free of nicks and burrs. Mount bearings on unused section of shafting or repair/replace shafting as required. Inspect both the shaft and bearing bore for debris or contaminants. Wipe clean as necessary.

**SM Gold Table 1**

Recommended Shaft Tolerances	
Nominal Bore Diameter	Tolerance (inch)
1/2 - 1 15/16	+0.0000 / -0.0005
2 - 3 3/16	+0.0000 / -0.0010
3 1/4 - 4 15/16	+0.0000 / -0.0015

### Step 2: Check Support Surfaces

Make sure the base of the housing and the support surfaces are clean and free from burrs. If the housing elevation is adjusted with shims these must cover the entire contact area between the housing and the support surface.

### Step 3: Install Unit

To aid installation, keep weight off bearing during mounting. Slide unit onto shaft by pushing on the inner ring. If it is difficult to mount bearing on shaft, use a piece of emery cloth to reduce any high spots on the shaft.

### Step 4: Fasten Unit in Place

Install housing mounting bolts and check bearing alignment. Align the bearing units as closely as possible. Tighten mounting bolts to recommended fastener torques. Check the shaft for freedom of rotation by rotating shaft with hand in both directions.

### Step 5: Position Insert

If expansion units are used, the insert must be located in the housing to allow for axial shaft expansion and/or contraction. Position bearing insert to obtain the required axial expansion in desired directions. It may be necessary to unload the bearing while moving the assembly.

## Sealmaster Gold Mounted Ball Bearing Housed Units Installation continued

### Step 6: Tighten Locking Mechanism

#### a. Setscrew Locking Inserts

Setscrews in multiple bearing applications should be aligned as shown.

Tighten bearing units to the shaft as follows:

i. Torque the first setscrew "A" to one half of the recommended torque in Table 2.

ii. Torque the second setscrew "B" to the full recommended torque. Go back to the first setscrew "A" and tighten to the full recommended torque.

If the bearing unit has setscrew locking on both sides of the inner ring (Double Lock Setscrew), repeat the same procedure for the second pair of setscrews. Check shaft again for freedom of rotation and then tighten the second bearing unit in the same fashion. When all bearings are tightened, perform a final check to the shaft for freedom of rotation.

**SM Gold Table 2**

Setscrew Torque		
Screw Size	Hex Size	Inch-Pounds
1/4-28	1/8	65 - 85
5/16-24	5/32	125 - 165
3/8-24	3/16	230 - 300
7/16-20	7/32	350 - 450
1/2-20	1/4	500 - 650
5/8-18	5/16	1100 - 1440

#### b. Skwezloc Locking Inserts

i. Be sure that the Skwezloc collar is fitted square and snug against the shoulder on the inner ring as shown.

ii. Torque the Skwezloc collar cap screw to the full recommended torque in Table 3.

**SM Gold Table 3**

Skwezloc Concentric Locking Collar Cap Screw Torque		
Screw Size	Torx Size	Inch-Pounds
# 8-32	T-25	70
# 10-24	T-27	100
1/4-20	T-30	240
5/16-18	T-45	495

Check shaft again for freedom of rotation and then tighten the second bearing unit in the same fashion. When all bearings are tightened, perform a final check to the shaft for freedom of rotation.

## Mounting Sealmaster Gold Cylindrical O.D. (ER Style) Inserts and Cylindrical O.D. Housings (AR & SC Style):

### NOTICE

• Do not strike or hammer on any component of the bearing and/or shaft. Impact can result in damage to the bearing that may cause reduction in bearing performance and may lead to equipment failure.

### Step 1: Inspect and Prepare Housing

To achieve proper bearing fit, the housing should be machined to the correct bore size. For recommended housing bore sizes, refer to page G-259. The housing bearing seat should be wiped clean and free of debris.

### Step 2: Install Unit in Housing

Press bearing into housing by applying force to the face of the housing, or the face of the outer ring for ER style bearings.

Do not hammer on any component of the bearing or apply force to the inner ring.

**Step 3: Refer to Steps 1 - 6 from the "Mounting Housed Bearing Units" Section Pages G-246 to G-247**

### Sealmaster Gold Expansion Bearings:

Expansion bearings allow for linear shaft expansion or contraction caused by temperature variations. Without this expansion capability, bearings may be subjected to excessive thrust loads and misalignment which could damage the bearing, mounting surfaces, and frameworks. Sealmaster offers two types of expansion (float) bearings:

1. In Sealmaster Gold mounted units where the bearing is installed into an AR ring then into a housing assembly as shown on page G-29. This design allows the bearing to move axially in the housing assembly. Table 4 below shows the allowable expansion by size.

**SM Gold Table 4**

Bore Diameter		Expansion (inch)
Standard Duty	Medium Duty	
1/2 - 1	N/A	3/32
1 3/16 - 1 3/4	15/16 - 1 1/2	1/8
1 15/16 - 2 15/16	1 11/16 - 2 11/16	3/16
3 - 3 7/16	2 15/16 - 3 3/16	1/4
3 1/2 - 4	3 7/16 - 4	9/32
5	4 7/16 - 4 15/16	7/16

2. In Sealmaster Cylindrical O.D. bearings (ER style) and some Sealmaster Gold mounted units expansion is achieved by utilizing a special half-dog & wire and keyway in the shaft by specifying a "HIY" suffix. The bearing then floats along the shaft. Table 5 shows the shaft slot dimensions required.

**SM Gold Table 5**

Bore Sizes	Slot Width (C)	Min. Slot Depth (B)	1/2 Dog Point Dia. (P)
inch	inch	inch	inch
1/2 to 1/4R	13/64	3/32	5/32
1 1/4 to 1 3/4	9/32	3/32	13/64
1 7/8 to 2 7/16	21/64	1/8	1/4
2 1/2 to 3 7/16	21/64	1/8	19/64
3 15/16 to 4	33/64	3/16	15/32

ΔL is calculated below

### Notes:

- Before installation, make certain proper expansion is accounted for. Expansion units should be placed in a location where relative movement between the bearing insert and the housing can be tolerated.
- When using an expansion bearing, always use a fixed bearing as the second support bearing.
- Half-dog setscrew and lock wire systems are not recommended for high speed or vibration applications. Application Engineering can be contacted for specifics. Only one half-dog setscrew should be used in this arrangement. No other setscrew should be installed. The half-dog setscrew's nub is engaged within the shaft slot, but not tightened into the shaft.

When shafting is heated, it grows longer. This growth in shaft length is particularly problematic when shafts are long and temperature differentials are large.

The difference in linear expansion between the shaft (shaft length between bearing centers) and the bearing mounting structure must be taken in consideration in high temperature applications. For example, in the case where the shaft, bearings and bearing support structure are all in a heated environment, the effect of thermal expansion on the bearings can be insignificant (assuming that all components are made of steel).

The shaft expansion concern arises when the shaft is in a heated environment but the bearings and bearing support structure are not. In this case the slot length in the shaft should be machined so as to accommodate the amount of linear shaft expansion.

Calculate the minimum slot length (ΔL) as follows:

$$\Delta L = \alpha \cdot X \Delta \text{TEMP}_{\text{sys}}$$

Where:

ΔL = differential linear expansion (inches)

α = coefficient of thermal expansion (inch/inch/°F)

(α = 7x10<sup>-6</sup> inch/inch/°F for most carbon steel shafting)

(α = 1x10<sup>-5</sup> inch/inch/°F for most stainless steel shafting)

X = length of shaft (inches)

ΔTEMP<sub>sys</sub> = operating shaft temperature (°F) - installed shaft temperature (°F)

## Replacing Existing Sealmaster Gold Inserts:

Note: Replacement Sealmaster bearing inserts are intended for use in Sealmaster housings only.

### NOTICE

- These bearings are designed for maximum permissible static misalignment of  $\pm 2$  degrees. Installation, handling or operation of the bearing in excess of the maximum of  $\pm 2$  degrees can cause reduction in bearing performance and may lead to equipment failure.

- Do not strike or hammer on any component of the bearing and/or shaft. Impact can result in damage to the bearing that may cause reduction in bearing performance and may lead to equipment failure.

### Step 1: Loosen and Remove Housing Mounting Bolts

### Step 2: Remove Bearing from Shaft

Loosen the locking mechanism and slide the bearing off the shaft.

### Step 3: Remove the Bearing Insert from the Housing

Secure housing in a vise. Remove lubrication fitting and lock pin from the housing. Do not discard the lubrication fitting or lock pin. Remove insert from housing in the following fashion:

a. For Spherical OD Inserts:

Using a bar placed in the insert bore as a lever, swing the insert to line up the outer ring with the load slots and remove insert from load slots.

b. For Expansion (AR) Inserts:

Slide the insert in the axial direction out of the housing.

### Step 4: Inspect and Prepare Housing

Housings should be inspected for damage prior to installation. Wipe housing bore clean as necessary and check that the lubrication hole is clean and free of debris. Wetting of the housing bore with oil or grease may be done to ease installation of bearing insert.

### Step 5: Load New Insert

With the bearing housing still in the vise, load the insert in the following fashion:

a. For Spherical OD Inserts:

i. Place the bearing insert into the housing load slots, positioning the insert outer ring dimple and lubrication hole in line with the housing lubrication hole.

ii. Using a bar placed in the insert bore as a lever, swing the insert into place within the housing. Insert should have a snug fit in the housing. If insert can be made to swivel by hand in the housing bore, fit is too loose and entire unit should be replaced. If heavy force is required, fit is too tight and entire unit should be replaced.

iii. Ensure alignment of the outer ring dimple and lubrication hole and housing lubrication hole.

b. For Expansion (AR) Inserts

i. Slide bearing insert into the housing.

ii. Ensure alignment of the outer ring dimple and lubrication hole, brass ring lubrication hole, and housing lubrication hole.

### Step 6: Install Lock Pin and Lubrication Fitting

Place the lock pin in the housing lubrication hole, ensuring that it seats in the outer ring dimple. Tighten the lubrication fitting into the housing lubrication hole until snug, then loosen  $\frac{1}{4}$  turn.

### NOTICE:

Over tightening or under tightening of the lubrication fitting may lead to reduction in bearing performance.

**Step 7: Refer to Steps 1 - 6 from the "Mounting Housed Bearing Units" Section Pages G-246 to G-247**

## Sealmaster Material Handling Mounted Ball Bearing Housed Units

### NOTICE

• These bearings are designed for maximum permissible static misalignment of  $\pm 1\ 1/2$  degrees. Installation, handling or operation of the bearing in excess of the maximum of  $\pm 1\ 1/2$  degrees can cause reduction in bearing performance and may lead to equipment failure.

• Do not strike or hammer on any component of the bearing and/or shaft. Impact can result in damage to the bearing that may cause reduction in bearing performance and may lead to equipment failure.

### Step 1: Inspect Shaft and Bore

Shaft should be within tolerance range shown in the table, clean and free of nicks and burrs. Mount bearings on unused section of shafting or repair/replace shafting as required. Inspect both the shaft and bearing bore for debris or contaminants. Wipe clean as necessary.

SM MH Table 1

Recommended Shaft Tolerances	
Nominal Bore Diameter	Tolerance (inch)
1/2 - 1 15/16	+0.0000 / -0.0005
2 - 3 3/16	+0.0000 / -0.0010

### Step 2: Check Support Surfaces

Make sure the base of the housing and the support surfaces are clean and free from burrs. If the housing elevation is adjusted with shims these must cover the entire contact area between the housing and the support surface.

### Step 3: Install Unit

To aid installation, keep weight off bearing during mounting. Slide unit onto shaft by pushing on the inner ring. If it is difficult to mount bearing on shaft, use a piece of emery cloth to reduce any high spots on the shaft.

### Step 4: Fasten Unit in Place

Install housing mounting bolts and check bearing alignment. Align the bearing units as closely as possible. Tighten mounting bolts to recommended fastener torques. Check the shaft for freedom of rotation by rotating shaft with hand in both directions.

## Sealmaster Material Handling Mounted Ball Bearing Housed Units continued

### Step 6: Tighten Locking Mechanism

#### a. Setscrew Locking Inserts

Setscrews in multiple bearing applications should be aligned as shown.

Tighten bearing units to the shaft as follows:

- i. Torque the first setscrew "A" to one half of the recommended torque in Table 2.
- ii. Torque the second setscrew "B" to the full recommended torque. Go back to the first setscrew "A" and tighten to the full recommended torque.

If the bearing unit has setscrew locking on both sides of the inner ring (Double Lock Setscrew), repeat the same procedure for the second pair of setscrews. Check shaft again for freedom of rotation and then tighten the second bearing unit in the same fashion. When all bearings are tightened, perform a final check to the shaft for freedom of rotation.

**SM MH Table 2**

Setscrew Torque		
Screw Size	Hex Size	Inch-Pounds
1/4-28	1/8	65 - 85
5/16-24	5/32	125 - 165
3/8-24	3/16	230 - 300

#### b. Skwezloc Locking Inserts

- i. Be sure that the Skwezloc collar is fitted square and snug against the shoulder on the inner ring as shown.
- ii. Torque the Skwezloc collar cap screw to the full recom-

mended torque in Table 3.

**SM MH Table 3**

Skwezloc Concentric Locking Collar Cap Screw Torque		
Screw Size	Torx Size	Inch-Pounds
# 8-32	T-25	70
# 10-24	T-27	100
1/4-20	T-30	240

Check shaft again for freedom of rotation and then tighten the second bearing unit in the same fashion. When all bearings are tightened, perform a final check to the shaft for freedom of rotation.

### Step 7: End Cover Installation

Position the cap so it is flush with the housing, and align the removal nub in the 12 o'clock position. Press evenly on end of cap by hand to install in the machined housing groove.

## Replacing Existing Sealmaster Material Handling Inserts:

Note: Replacement Sealmaster bearing inserts are intended for use in Sealmaster housings only.

### NOTICE

- These bearings are designed for maximum permissible static misalignment of  $\pm 1\ 1/2$  degrees. Installation, handling or operation of the bearing in excess of the maximum of  $\pm 1\ 1/2$  degrees can cause reduction in bearing performance and may lead to equipment failure.

- Do not strike or hammer on any component of the bearing and/or shaft. Impact can result in damage to the bearing that may cause reduction in bearing performance and may lead to equipment failure.

### Step 1: Loosen and Remove Housing Mounting Bolts

### Step 2: Remove Bearing from Shaft

Remove the end cover. Loosen the locking mechanism and slide the bearing off the shaft.

### Step 3: Remove the Bearing Insert from the Housing

Secure housing in a vise. Using a bar placed in the insert bore as a lever, swing the insert to line up the outer ring with the load slots and remove insert from load slots.

### Step 4: Inspect and Prepare Housing

Housings should be inspected for damage prior to installation. Wipe housing bore clean as necessary and check that the lubrication groove and hole are clean and free of debris. Wetting of the housing bore with oil or grease may be done to ease installation of bearing insert.

### Step 5: Load New Insert

With the bearing housing still in the vise, load the insert in the following fashion:

a. Place the bearing insert into the housing load slots, positioning the anti rotation rivet on the outer ring in the load slot as to not shear it off when the swinging insert into place. Also, position the outer ring lubrication hole so it will install in line with the housing lubrication hole.

b. Using a bar placed in the insert bore as a lever, swing the insert into place within the housing. Insert should have a snug fit in the housing. If insert can be made to swivel by hand in the housing bore, fit is too loose and entire unit should be replaced. If heavy force is required, fit is too tight and entire unit should be replaced.

c. Ensure alignment of the anti rotation rivet in the load slot and outer ring lubrication hole in the housing lubrication hole.

### Step 6: Refer to Steps 1 - 6 from the "Mounting Housed Bearing Units" Section Pages G-251 to G-252

## Sealmaster Gold and Material Handling Bearing Lubrication:

All Sealmaster Gold and Material Handling Ball Bearings are delivered with a high quality lithium complex grease with an EP additive. The bearing is ready for use with no initial lubrication required. The grease consists of a lithium complex thickener, mineral oil, and NLGI grade 2 consistency. Compatibility of grease is critical; therefore consult with Application Engineering and your grease supplier to insure greases are compatible. For best performance it is recommended to relubricate with lithium complex thickened grease with a comparable NLGI consistency and base oil properties.

Relubricatable Sealmaster bearings are supplied with grease fittings or zerks for ease of lubrication with hand or automatic grease guns. Always wipe the fitting and grease nozzle clean.

**Note:** Sealmaster bearings with the RM suffix are Reduced Maintenance Bearings (ex. NP-16 RM). Sealmaster Reduced Maintenance Bearings are designed to operate with the standard factory fill of grease and are designed not to be lubricated.

**CAUTION:** If possible, it is recommended to lubricate the bearing while rotating, until grease purge is seen from the seals. If this is not an option due to safety reasons, follow the alternate lubrication procedure below.

### Re-Lubrication Procedure:

Stop rotating equipment. Add one half of the recommended amount shown in Table 1. Start the bearing and run for a few minutes. Stop the bearing and add the second half of the recommended amount. A temperature rise after lubrication, sometimes 30°F (17°C), is normal. Bearing should operate at temperatures less than 200°F (94°C) and should not exceed 250° (121°C) for intermittent operation. For lubrication guidelines, see Tables 2 and 3.

**Note:** Tables 2 and 3 are general recommendations. Experience and testing may be required for specific applications.

**Note:** Grease charges in Table 1 are based on the use of lithium complex thickened grease with a NLGI grade 2 consistency.

**Note:** The Maximum Operational Speeds listed in Table 2 and 3 are based on the use of a single lock setscrew insert with felt seals. For maximum operational speeds of other locking mechanisms and seals, refer to speed rating section or consult Application Engineering.

### LO and XLO Relubrication Frequency

LO and XLO bearings are designed for applications which require the bearing to operate with less torque or drag than a standard bearing.

**Note:** Addition of lubricant to the bearing will increase bearing drag.

If relubrication is necessary:

1. Add a very small amount of lubricant
2. Check bearing rotational torque (be sure that the bearing still rotates freely enough for the application.)

**Sealmaster Ball Lube Table 1 / Grease Charge for Relubrication**

Series	Bore Diameter		Grease Charge (Mass - Ounces)	Bore Diameter Material Handling Bearing	Grease Charge (Mass - Ounces)
	Gold - Performance				
	Standard Duty	Medium Duty			
2-012	1/2 - 3/4	-	0.03	-	-
2-015	13/16 - 1	-	0.04	1	0.03
2-13	1 1/16 - 1 1/4R	15/16 - 1	0.09	1 1/16 - 1 1/4R	0.06
2-17	1 1/4 - 1 7/16	1 3/16	0.13	1 1/4 - 1 7/16	0.09
2-19	1 1/2 - 1 9/16	1 7/16	0.18	1 1/2 - 1 9/16	0.14
2-111	1 5/8 - 1 3/4	1 1/2	0.20	1 5/8 - 1 3/4	0.16
2-115	1 13/16 - 2R	1 11/16 - 1 3/4	0.22	1 13/16 - 2R	0.18
2-23	2 - 2 3/16	1 15/16	0.30	2 - 2 3/16	0.25
2-27	2 1/4 - 2 7/16	2 3/16	0.38	-	-

2-37	3 1/4 - 3 7/16	3 3/16	1.11	-	-
2-38	3 1/2	3 7/16	1.37	-	-
2-43	3 15/16 - 4 3/16	3 15/16 - 4	2.50	-	-
2-47	5	4 7/16 - 4 15/16	3.91	-	-

## Sealmaster Relubrication Frequency

**Sealmaster Ball Lube Table 2**

Environment	Temperature (°F)	Speed (% Catalog Max)	Frequency
Dirty	-20 to 250	0 - 100%	Daily to 1 Week
		0 - 25%	4 to 10 Months
Clean	-20 to 125	26 - 50%	1 to 4 Months
		51 - 75%	1 Week to 1 Month
		76 - 100%	Daily to 1 Week
		0 - 25%	2 to 6 Weeks
	125 to 175	26 - 50%	1 Week to 1 Month
		51 - 75%	Daily to 1 Week
		76 - 100%	
	175 to 250	0 - 100%	

## Sealmaster High Temperature Suffix Modified Bearing Relubrication Frequency

**Sealmaster Ball Lube Table 3**

Environment	Temperature (°F)	Speed (% Catalog Max)	HT / HTC / HTA Suffix (1)	HI Suffix (2)
Dirty	-20 to 400	0 - 100%	Daily to 1 Week	Daily to 1 Week
		0 - 25%	1 to 3 Months	6 to 12 Months
Clean	200 to 300	26 - 50%	2 to 6 Weeks	2 to 6 Months
		51 - 75%	Daily to 1 Week	2 Weeks to 2 Months
		76 - 100%	Daily to 1 Week	Daily to 1 Week
		0 - 25%	2 Weeks to 1 Month	3 to 6 Months
	300 to 400	26 - 50%	1 to 2 Weeks	1 to 3 Months
		51 - 75%	Daily to 1 Week	1 Week to 1 Month
		76 - 100%	Daily to 1 Week	Daily to 1 Week
		0 - 25%	2 Weeks to 1 Month	3 to 6 Months

(1) Use high quality lithium complex grease, NLGI#2 and synthetic hydrocarbon oil with ISO 220 viscosity

(2) Use Krytox GPL-226, no substitutions

## Browning Mounted Ball Bearing Housed Units

### NOTICE

• These bearings are designed for maximum permissible static misalignment of  $\pm 1\ 1/2$  degrees. Installation, handling or operation of the bearing in excess of the maximum of  $\pm 1\ 1/2$  degrees can cause reduction in bearing performance and may lead to equipment failure.

• Do not strike or hammer on any component of the bearing and/or shaft. Impact can result in damage to the bearing that may cause reduction in bearing performance and may lead to equipment failure.

### Step 1: Inspect Shaft and Bore

Shaft should be within tolerance range shown in the table, clean and free of nicks and burrs. Mount bearings on unused section of shafting or repair/replace shafting as required. Inspect both the shaft and bearing bore for debris or contaminants. Wipe clean as necessary.

BMD Table 1

Recommended Shaft Tolerances	
Nominal Bore Diameter	Tolerance (Inches)
1/2 - 1 15/16	+0.0000 / -0.0005
2 - 2 7/16	+0.0000 / -0.0010

### Step 2: Check Support Surfaces

Make sure the base of the housing and the support surfaces are clean and free from burrs. If the housing elevation is adjusted with shims these must cover the entire contact area between the housing and the support surface.

### Step 3: Install Unit

To aid installation, keep weight off bearing during mounting. Slide unit onto shaft by pushing on the inner ring. If it is difficult to mount bearing on shaft, use a piece of emery cloth to reduce any high spots on the shaft.

### Step 4: Fasten Unit in Place

Install housing mounting bolts and check bearing alignment. Align the bearing units as closely as possible. Tighten mounting bolts to recommended fastener torques. Check the shaft for freedom of rotation by rotating shaft with hand in both directions.

## Browning Mounted Ball Bearing Housed Units continued

### Step 5: Tighten Locking Mechanism

#### a. Setscrew Locking Inserts

Setscrews in multiple bearing applications should be aligned as shown.

Tighten bearing units to the shaft as follows:

- i. Torque the first setscrew "A" to one half of the recommended torque in Table 2.
- ii. Torque the second setscrew "B" to the full recommended torque. Go back to the first setscrew "A" and tighten to the full recommended torque.

**BMD Table 2**

Setscrew Recommended Torque		
Screw Size	Hex Size	Inch-Pounds
1/4-28	1/8	65 - 85
5/16-24	5/32	125 - 165
3/8-24	3/16	230 - 300
7/16-20	7/32	350 - 450
1/2-20	1/4	500 - 650
5/8-18	5/16	1100 - 1440

#### b. Eccentric Locking Inserts

- i. Place collar on inner race and rotate by hand in direction of shaft rotation until eccentrics are engaged.
- ii. Insert drift pin into the hole in the collar O.D. (B) and lock in direction of shaft rotation with the aid of small hammer.
- iii. Torque single setscrew (A) to recommended torque in Table 3.

**BMD Table 3**

Eccentric Locking Recommended Torque		
Screw Size	Hex Size	Inch-Pounds
1/4-28	1/8	65 - 85
5/16-24	5/32	125 - 165
3/8-24	3/16	230 - 300
7/16-20	7/32	350 - 450
1/2-20	1/4	500 - 650
5/8-18	5/16	1100 - 1440

#### c. BOA Locking Inserts

- i. Be sure that the BOA collar is fitted square and snug against the shoulder on the inner ring as shown.

- ii. Torque the BOA collar cap screw to the full recommended torque in Table 4.

**BMD Table 4**

BOA Concentric Locking Collar Cap Screw Torque		
Screw Size	Torx Size	Inch-Pounds
# 8-32	T-25	70
# 10-24	T-27	100
1/4-20	T-30	240
5/16-18	T-45	495

Check shaft again for freedom of rotation and then tighten the second bearing unit in the same fashion. When all bearings are tightened, perform a final check to the shaft for freedom of rotation.

## Mounting Cylindrical O.D. (VER Style) Inserts:

### Step 1: Inspect and Prepare Housing

To achieve proper bearing fit, the housing should be machined to the correct bore size. For recommended housing bore sizes, refer to the Browning bearing catalog or consult Application Engineering. The housing bearing seat should be wiped clean and free of debris.

### Step 2: Install Unit in Housing

Press bearing into housing by applying force to the face of the outer ring. Do not hammer on any component of the bearing or apply force to the inner ring.

### Step 3: Refer to Steps 1 - 5 from the "Mounting Housed Bearing Units" Section Pages G-255 to G-256

## Replacing Existing Browning Inserts:

**Note:** Replacement Browning bearing inserts are intended for use in Browning housings only.

### Step 1: Loosen and Remove Housing Mounting Bolts

### Step 2: Remove Bearing from Shaft

Loosen the locking mechanism and slide the bearing off the shaft.

### Step 3: Remove the Bearing Insert from the Housing

Secure housing in a vise. Using a bar placed in the insert bore as a lever, swing the insert to line up the outer ring with the load slots and remove insert from load slots.

### Step 4: Inspect and Prepare Housing

Housings should be inspected for damage prior to installation. Wipe housing bore clean as necessary and check that the lubrication groove and hole are clean and free of debris. Wetting of the housing bore with oil or grease may be done to ease installation of bearing insert.

### Step 5: Load New Insert

With the bearing housing still in the vise, load the insert in the following fashion:

- Place the bearing insert into the housing load slots, positioning the anti rotation rivet on the outer ring in the load slot as to not shear it off when the swinging insert into place. Also, position the outer ring lubrication hole so it will install in line with the housing lubrication hole.

- Using a bar placed in the insert bore as a lever, swing the insert into place within the housing. Insert should have a snug fit in the housing. If insert can be made to swivel by hand in the housing bore, fit is too loose and entire unit should be replaced. If heavy force is required, fit is too tight and entire unit should be replaced.

- Ensure alignment of the anti rotation rivet in the load slot and outer ring lubrication hole in the housing lubrication hole.

### Step 6: Refer to Steps 1 - 5 from the "Mounting Housed Bearing Units" Section Pages G-255 to G-256

## Browning Mounted Ball Lubrication:

All Browning Ball Bearings are delivered with a high quality lithium complex grease with an EP additive. The bearing is ready for use with no initial lubrication required. The grease consists of a lithium complex thickener, mineral oil, and NLGI grade 2 consistency.

Compatibility of grease is critical; therefore consult with Application Engineering and your grease supplier to insure greases are compatible. For best performance it is recommended to relubricate with lithium complex thickened grease with a comparable NLGI consistency and base oil properties.

Relubricatable Browning bearings are supplied with grease fittings or zerks for ease of lubrication with hand or automatic grease guns. Always wipe the fitting and grease nozzle clean.

**CAUTION:** If possible, it is recommended to lubricate the bearing while rotating, until grease purge is seen from the seals. If this is not an option due to safety reasons, follow the alternate lubrication procedure below.

### Re-Lubrication Procedure:

Stop rotating equipment. Add one half of the recommended amount shown in Table 1. Start the bearing and run for a few minutes. Stop the bearing and add the second half of the recommended amount. A temperature rise after lubrication, sometimes 30°F (17°C), is normal. Bearing should operate at temperatures less than 200°F (94°C) and should not exceed 250° (121°C) for intermittent operation. For lubrication guidelines, see Table 2.

**Note:** Table 2 is general recommendations. Experience and testing may be required for specific applications.

**Note:** Grease charges in Table 1 are based on the use of lithium complex thickened grease with a NLGI grade 2 consistency.

**Browning Lube Table 1**  
**Grease Charge for Relubrication**

Series	Shaft Size		Grease Charge (Mass - Ounces)
	100 & 200 Series	300 Series	
	Intermediate & Standard Duty	Medium Duty

# Cylindrical OD Housing Fit Guidelines

Tables 14-15 list fit up guidelines for light load conveyor roll application per ABMA J6 fit. Testing and experience is needed to verify if this fit is sufficient for specific operation conditions. If tighter press fit is needed, contact Application Engineering to review if the standard bearing internal clearance is sufficient or a modified clearance is needed to prevent reduction or elimination of internal clearance.

For best reliability, bearings and housings should be selectively matched to reduce variation in fit up due to manufacturing tolerances of the bearing outside diameter and housing bore. Roll pockets should be machined parallel with the axis of the shaft and both sides should be on the same centerline to minimize potential for misalignment.

### Table 14 - ER, VER and Cylindrical OD Insert Bearing Housing/Roll Bore

This chart displays the recommended housing dimensions for Sealmaster ER and Browning VER ball bearings at the various bore diameters and nominal Outer Diameter. For Sealmaster ER with Skwezloc Concentric locking use the similar size ER with setscrew locking as shown. For other Browning Cylindrical O.D. bearings use the similar nominal dimensioned bearing.

\* Outside diameter may be slightly oversized due to seal press fit, dimensions listed are as measured prior to seal assembly.

This chart displays the recommended housing dimensions for Sealmaster SC and MSC ball bearings at the various bore diameters and nominal Outer Diameter. For Sealmaster SC and MSC with Skwezloc Concentric locking use the similar size SC or MSC with setscrew locking as shown.

For additional assistance contact Application Engineering at (800) 626-2093.

# Vibration Analysis

## BALL BEARINGS VIBRATION ANALYSIS

The following equations are used to calculate the fundamental frequencies for Sealmaster and Browning Ball Bearings.

1. If the insert number is known, proceed to step 2. For housed units, identify the bearing insert number by looking up the unit in the dimension tables, then proceed to step 2.
2. Find the Sealmaster or Browning insert number in Table 16 below and identify the series.
3. Select the vibration geometry information (O, I, B, F) from Table 16.
4. Use this information to calculate the fundamental bearing frequencies:
  - Outer Ball Pass Frequency (Hz) = O x RPM
  - Inner Ball Pass Frequency (Hz) = I x RPM
  - Ball Spin Frequency (Hz) = B x RPM
  - Fundamental Train Frequency (Hz) = F x RPM

Symbol Description Units

RPM = Revolutions per Minute RPM

O = Outer Race Frequency Factor

I = Inner Race Frequency Factor

B = Ball Spin Frequency Factor

F = Fundamental Train Frequency Factor

For specific bearing insert, refer to load rating page G-227 to G-229 to determine series

\*L-10 series only applies to Browning units for the Bore Diameters shown. For VER-208 and 210 units use the 2-012 series values

**Mounted Ball Bearing Engineering see page G-220.**

For more information on bearing capabilities outside of our standard offering, please contact Application Engineering (800) 626-2093.

# *Mounted Spherical Roller Bearings*

Modular bearing assembly consisting of sealed and lubricated inch spherical bearing with collar (setscrew) or concentric (adapter mount) locking system contained within a variety of housings types, mounting styles, and housing materials. Mounted spherical roller bearings provide an antifriction solution when supporting rotating shafts with combination radial and thrust loads.

## **Housing Styles**

Pillow Block, Flanges, Take Up Assemblies

## **Locking Styles**

Collar (Setscrew) Or Concentric (Adapter Mount)

## **Bore Size Range**

1 1/8" To 8"

## **Housing Materials**

Cast & Ductile Iron

## Mounted Roller Bearing Selection Guide

		Series	Housing style
Sealmaster USRB		USRB5000	Two Bolt Pillow Block
		USRBF5000	Four Bolt Pillow Block
		USRB5000	Four Bolt Pillow Block (No F prefix for 4 7/16" - 4 15/16")
		USRB5500	Two Bolt Pillow Block (SAF mounting dimensions)
		USRBF5500	Four Bolt Pillow Block (SAF mounting dimensions) (F prefix for 2 7/16" - 3 7/16")
		USRB5500	Four Bolt Pillow Block (SAF mounting dimensions) (F prefix for 3 15/16" - 8")
		USFB5000	Four Bolt Flange

## Sealmaster USRB Performance Mounted Spherical Roller Bearing

Sealmaster USRB performance mounted spherical roller bearings feature black oxide treated bearing steel races with optimized bearing geometry for load capacity, misalignment and speed capabilities. The USRB is available in both setscrew locking and adapter mounting system. The felt seal with flinger provides a good balance between contaminant entry, grease retention and friction. Depending on application requirements, these bearings are available in a wide variety of bore sizes, housing styles, and sealing options as illustrated on the pages to follow.

# Spherical Roller Bearing Nomenclature

- Unitized**
- Spherical**
- Housing Type** (\* see below)
- Bolts**
  - F - Four Bolt Base - 2 7/16" to 4"  
Where Two Bolt & Four Bolt Options Exist
  - No Prefix - Standard Option
  - Two Bolt Only - 1 1/8" to 2 3/16"
  - Four Bolt Only - 4 7/16" - 8"
- Type E Mounting Dimensions Series**
  - 000 - Standard Series
  - 5xx - SAF Mounting Dimensions
- Locking Option**
  - A - Adapter Mount
  - No Suffix - Collar Mount (setscrew)
- Expansion Option**
  - E - Expansion
  - No Suffix - Non Expansion
- Bore Size (Inch)**
  - First Digit - Number of Inches
  - Second & Third Digit - Number of 1/16 of inches (ex. 207 = 2 7/16")
- Seal Option**
  - C - Contact Seal
  - N - Nomex Seal

**U S RB F E 5000 A E - 207 - C**

- \* Housing Type**
- RB - Roller (Pillow) Block
  - FB - Flange Block
  - FC - Flange Cartridge
  - TA - Top Angle Take Up
  - TU - Wide Slot Take-Up
  - BF - Flange Bracket
  - I - Insert

## Features and Benefits

### Double Row Spherical Roller Bearing

New geometries developed and manufactured by Sealmaster result in an innovative double-row spherical roller bearing with optimal load capacity, misalignment and speed capability.

### Multiple Housing Configurations

### One Piece Cast Iron and Ductile Iron Housings

Durable one piece cast iron (USRB5000 series) and ductile iron (USRBE5000 series) housings provide load support. Two and four bolt pillow block housings have elongated bolt holes for interchangeability with competitive units.

### Split Housings

Durable split housings (USRB5500 series) designed to the industry standard SAF footprint and replaceable cartridge inserts from 1 3/8" - 8" are shaft ready for easy installation.

### Multiple Sealing Options

### Felt Seal

The Sealmaster felt seal with flinger, mounted between races, can accommodate  $\pm 2^\circ$  of misalignment. The outer member rotates with the inner race to help direct contamination away from the seal. Due to the unique spherical geometric design of the seal contact areas, sealing effectiveness is maintained throughout the entire specified range of misalignment. This design provides a tight labyrinth seal, which acts as a filter to help exclude foreign material and has low friction.

### Contact Seal

The Sealmaster double-lip contact seal, mounted between races, also can accommodate  $\pm 2^\circ$  of misalignment. The outer member rotates with the inner race, to help direct contamination away from the seal. Due to the unique spherical geometric design of the seal contact areas, sealing effectiveness is maintained throughout the entire specified range of misalignment. The rotating double-lip seal design allows for exceptional limiting speed.

## Features and Benefits

### Multiple Locking Methods

#### Collar Mount System

Sealmaster performance mounted roller bearings feature locking collars and setscrews at 120°, providing a balanced three-point contact.

#### Adapter Mount System

The Sealmaster performance mounted roller bearings grip the shaft with an advanced adapter mount system, for fast installation and removal. The advanced integral locking system incorporates axial cap screws that allow mount and dismount of the bearing from one side. The result: this highly engineered locking system requires less installation torque. Sealmaster adapter mount spherical roller bearings are also shaft ready and require only a hex key and torque wrench to install; no special tools or feeler gauges are required.

Learn more with your phone...Snap the QR code with your mobile phone, and watch a video demonstrating the ease of installation and removal of the Sealmaster Unitized Spherical Bearing. New-model phones come with QR readers. If yours doesn't, go to the app store and search QR Reader.

#### Replaceable Cartridge Insert

The Sealmaster performance mounted roller bearings have a replaceable cartridge insert that consists of a double-row spherical roller bearing with race-mounted seals. These integrally sealed, one-piece cartridge inserts can also be used for mounting in cylindrical-bore housings for an even wider range of applications.

#### Wide Outer Race

The wide outer race, coupled with innovative rolling-element geometries, provides increased load capacity. The wide outer race also allows for race mounted seals and creates a large internal grease chamber, for more grease capacity.

#### Misalignment

The arrangement of rolling elements and races in Sealmaster Mounted Spherical Roller Bearings can accommodate  $\pm 2$  degrees of misalignment – up to twice an SAF – while maintaining catalog load ratings and sealing effectiveness. The spherical bearing design can accommodate both static and dynamic misalignment which may exist due to structure mounting irregularities, shaft deflection, or other application conditions.

\*For expansion bearings, this dimension can increase by the corresponding value in table VIII on page I-69.  
 One expansion unit is to be used in conjunction with one non-expansion unit for applications using an adapter lock unit  
 Failure to utilize one expansion and one non-expansion unit is likely to result in reduced bearing performance.

\*For expansion bearings, this dimension can increase by the corresponding value in table VIII on page I-69.

Metric dimensions for reference only.  
 Not all parts are available from stock. Please contact customer service for availability (800) 626-2120.  
 For more information on bearing capabilities outside of our standard offering, please contact Application Engineering (800) 626-2093.

# Performance Mounted Spherical Roller Bearings **SEALMASTER®**

- Rolling Elements:** Spherical Roller
- Housing:** Cast Iron Four Bolt Flange
- Self Alignment:** +/- 2 Degrees
- Lock:** Adapter
- Seal:** Felt
- Optional Seal:** Double Lip Contact
- Temperature:** -20° to 220° F

\*For expansion bearings, this dimension can increase by the corresponding value in table VIII on page I-69. One expansion unit is to be used in conjunction with one non-expansion unit for applications using an adapter lock unit. Failure to utilize one expansion and one non-expansion unit is likely to result in reduced bearing performance.

\*For expansion bearings, this dimension can increase by the corresponding value in table VIII on page I-69.  
 One expansion unit is to be used in conjunction with one non-expansion unit for applications using an adapter lock unit  
 Failure to utilize one expansion and one non-expansion unit is likely to result in reduced bearing performance.

Metric dimensions for reference only.

Not all parts are available from stock. Please contact customer service for availability (800) 626-2120.

For more information on bearing capabilities outside of our standard offering, please contact Application Engineering (800) 626-2093.

# *Mounted Tapered Roller*

Modular bearing assembly consisting of sealed and lubricated inch or metric tapered bearing with setscrew locking collars contained within a variety of housings types, mounting styles, and housing materials. Mounted tapered roller bearings provide an antifriction solution when supporting rotating shafts with combination radial and thrust loads.

## **Housing Styles**

Pillow Block, Flanges, Take Up Assemblies

## **Locking Styles**

Setscrew

## **Bore Size Range**

1 3/16" to 5" and 35mm to 125mm

## **Housing Materials**

Cast Iron, and Cast Steel

Mtd. Tapered Bearings

## Sealmaster Tapered Roller Bearings

Sealmaster® RPB mounted tapered roller bearings are a dimensionally interchangeable upgrade from competitive Type E bearings. The exclusive features include unitized replaceable inserts, self aligning capability, split housing and the Sealmaster alignment pin which provides for a direct path for lubrication into the bearing and helps prevent outer ring rotation. The Sealmaster RPB is available with two traditional setscrew locking collars for easy installation. The felt seal with flinger provides a good balance between contaminant entry, grease retention and friction. Depending on application requirements, these bearings are available in both inch and metric with a wide variety of housing, sealing, and lubrication options as illustrated on the pages to follow.

Mtd. Tapered Bearings

# Tapered Roller Bearing Nomenclature

**ERPBA - 107 - C2CR**

- Optional Prefix**  
E - Expansion
- Housing Type** (\* see below)
- Optional Suffix**  
A - Single Lock Collar  
No Suffix - Two Lock Collars
- Bore Size**  
Inch - First Digit - Number of Inches  
Second & Third Digit - Number of 1/16" of Inches (ex. 107 = 1 7/16")  
Metric - 65 mm = 65 mm
- Seal Option**  
C - Contact Seal  
N - Nomex Seal  
No Suffix - Felt Seal
- Bolts**  
2 - Two Bolt Base  
4 - Four Bolt Base
- Options**  
CR - Corrosion Resistant (see page K-19)  
AH - Air Handling  
TF - Tight Fit  
RC - Reduced Internal Clearance

**ERCI - A - 215**

- \*Housing Type**  
RPB - Roller Pillow Block  
DRPB - Roller Pillow Block (DI)  
RPBXT - Roller Pillow Block (SAF Mounting Dim.)  
SPB - Steel Pillow Block  
RFB - Roller Flange Block  
RFP - Roller Flange Pilot
- Optional Prefix**  
E - Expansion
- Housing Type**  
RCI - Replaceable Cartridge Insert
- Optional Suffix**  
A - Single Lock Collar  
No Suffix - Two Lock Collars
- Bore Size**  
Inch - First Digit - Number of Inches  
Second & Third Digit - Number of 1/16" of Inches (ex. 215 = 2 15/16")

## Features and Benefits

Mtd. Tapered Bearings

### Tapered Roller Bearings

Sealmaster RPB series contains heavy duty tapered roller bearings for radial, thrust and combination loading.

### Durable Cast Iron Split Housing

Durable cast iron split housings allow for quick insert replacement when change-out is required. Once installed, the base remains fixed and aligned with the shaft, reducing downtime and maintenance costs. Guide pin in the housing base orientates the proper assembly of the cap during replacement. Pillow block housings have elongated bolt holes for interchangeability with other competitive units. Permanent metal nameplate allows for easy identification after years of operation. Multiple housing styles include 2 and 4 bolt pillow block (RPB), 4 bolt flange (RFB), Piloted flange (RFP). Inch and metric bore size from 1 3/16" – 5" bore and 35 to 125 mm.

### Replaceable Cartridge Insert (RCI)

The heart of the RPB is the unitized, self-aligning cartridge insert with integral seals and double locking collars. The replaceable cartridge insert can accommodate +/- 3° static misalignment and is factory sealed and lubricated. The cartridges fit all housing styles and are field replaceable for quick change out. RCI outer races are black oxide treated.

### Felt Seals

Patented race mounted felt lined flinger seals help filter out contaminants and are not subject to misalignment distortion. The felt acts as a filter to help exclude contaminants. The rotating flinger helps repel contaminant build-up on the seal surfaces. Felt seal stampings are black oxidized.

## Features and Benefits continued

### Single Lip Contact Seal

Single lip race mounted contact seals for dry, dirty and wet conditions. It's composed of a steel inner seal with a bonded elastomeric sealing member. The steel inner seal is press fit into the inside diameter of the outer race, while the bonded elastomeric sealing member is held in the proper rubbing contact position on the outer diameter of the inner race. Contact seal stampings are black oxidized.

### Positive Lubrication System

Positive lubrication system provides direct grease path to the bearing. The unit is designed with two lubrication ports in the cartridge OD so that one of lube holes in cartridge lines up with grease fitting regardless of insert orientation in the housing. A rubber grommet in housing top recess directs lubricant into bearing cavity. Extra lubrication ports help prevent seal damage by venting excess pressure from over greasing. Sealmaster alignment pin helps prevent outer race rotation.

### Collar Mount System

Two locking collars are standard on all units with two setscrews at 120° for balanced three point contact. Precision manufactured diamond faceted point setscrew design contributes to improved clamping and resistance to back out. Single locking collars are available where space limitations are present. Locking collars are black oxidized.

## Additional Configurations

### Expansion Roller Bearing Pillow Blocks

Axial shaft expansion is compensated by a non-expansion (fixed) and expansion (float) arrangement. It is recommended to use both units on one shaft in high temperature applications to help account for linear shaft expansion.

### ERCI Cylindrical Cartridge Inserts

Cylindrical cartridge inserts (ERCI) are used in standard expansion ERPB housings or can be mounted into customer designed housings.

## Additional Configurations continued

### DRPB Series

Interchangeable with most type DI mounting dimensions

### DRPBA Series

Interchangeable with most Type K mounting dimensions

### RPBXT Series

Interchangeable with four bolt SAF mounting dimensions in shaft sizes from 2 1/4" - 5" (60mm - 125mm).

### SPB Series

This series incorporates all features of the standard RPB with cast steel housings in two and four bolt pillow blocks in shaft sizes from 1 1/2" - 5" (40mm - 125mm).

### Air Handling

RPB-AH Series designed for HVAC applications. It incorporates all features of the standard RPB with a custom AH fit between the bearing cartridge OD and the bearing housing, which provides lower misalignment torque.

Available in the RPB, RFB & RFP and DRPB Series

### RPB-MM Series

Incorporates all the features of the standard RPB but with metric bore sizes from 35-125mm and metric setscrews

## Options

- Custom housing configurations
- Custom lubricants, including synthetic and food grade greases and oil saturated polymers

### Tight Housing Fit “TF”

(TF suffix) for applications with vibration and rotating loads

### High Temperature “N”

High temperature bearing with Nomex\* seal and high temperature synthetic grease.

### Reduced Bearing Internal Clearance “RC”

(RC suffix) for specific application requirements

# Browning<sup>®</sup> E920 Series Tapered Roller Bearing

Browning<sup>®</sup> 920 series mounted tapered roller bearings feature one-piece durable cast iron non-expansion housings with Type E mounting dimensions and limited misalignment. The E920 series contains setscrew locking collars for easy installation and contact face riding seals to provide a good balance between contaminant entry, grease retention and friction. Depending on your application requirements, these bearings are available in a wide variety of bore sizes and housing configurations as illustrated on the pages to follow.

# E920 Series Tapered Roller Nomenclature

## Housing Assembly

## Take-Up Frames

## Features and Benefits

Mtd. Tapered Bearings

### Tapered Roller Bearings

Browning® E920 Series mounted tapered roller bearings are available from 1 3/16" to 5" in a two and four bolt pillow blocks, four bolt flanges and take-up housing styles. All units are completely assembled, adjusted and lubricated at the factory and are ready for use.

### Heavy Duty Tapered Roller Bearings

Heavy duty tapered roller bearings for radial, thrust and combination loading.

### One-Piece Cast Iron Housing

Durable one-piece cast iron housings provide support load.

### Contact Seal

Rubber contact face riding seals rotate with the shaft to help retain lubricant and help exclude contaminants.

### Collar Mount System

Two locking collars are standard on all units with two setscrews at 120° for balanced three point contact and holding power. Locking collars are black oxide treated.

Part Numbers are specified by TUE 920 and bore size: Example, TUE920 x 1 3/16.  
 These Take-Up Bearings are to be used with Take-Up Frames shown on page I-45 and I-46.  
 Bearing unit and frame must be ordered separately.

\* Take -Up frames not available in these sizes.

**Housing:** All Steel Take-Up Frame, Removable Top Permits Assembling Of Take-Up Unit On Shelf Before Inserting In Take-Up Frame

Mtd. Tapered Bearings

Part Numbers are specified by "T1000" with travel adjustment and bore size.  
 Example 12-16.6T1000 has 12"-16.6" adjustment and will accommodate a TUE920x 2 7/16" or USTU5000-207 bearing unit.  
 These Take-Up Frames are to be used with TUE Take-Up Units shown on page I-44 and USTU Take-Up Units shown on page H-21.  
 Bearing unit and frame must be ordered separately.  
 Frames give greater ACTUAL adjustment, often permitting use of shorter, more compact frames.  
 Frames with over 12" nominal adjustment have a third foot in the center for extra support.

Metric dimensions for reference only.  
 Not all parts are available from stock. Please contact customer service for availability (800) 626-2120.  
 For more information on bearing capabilities outside of our standard offering, please contact Application Engineering (800) 626-2093.

# Load Ratings and Life

## Life Calculations

The L10 (rating) life for any given application and bearing selection can be calculated in terms of millions of revolutions by using the bearing Basic Dynamic Rating and applied radial load (or, equivalent radial load in the case of radial bearing applications having combined radial and thrust loads). The L10 life for any given application can be calculated in terms of hours, using the bearing Basic Dynamic Rating, applied load (or equivalent radial load) and suitable speed factors. The BDR for double row spherical roller bearings is based on one million revolutions and the equation to calculate their L10 life is as follows:

### Spherical Roller Bearing

$$L_{10} = \left(\frac{C}{P}\right)^{10/3} \times \frac{1,000,000}{60 \times n} = \left(\frac{C}{P}\right)^{10/3} \times \frac{16667}{n}$$

Where:  $L_{10}$  = The # of hours that 90% of identical bearings under ideal conditions will operate at a specific speed and condition before fatigue is expected to occur.

- C = Basic Dynamic Rating (lbs)  
1,000,000 Revolutions
- P = Constant Equivalent Radial Load (lbs)
- n = Speed (RPM)

The BDR for tapered roller bearings is based on 90 million revolutions instead of one million for other types of bearings. Therefore there is a specific equation used to calculate their L10 life.

### Tapered Roller Bearing

$$L_{10} = \left(\frac{C90}{P}\right)^{10/3} \times \frac{90,000,000}{60 \times n} = \left(\frac{C90}{P}\right)^{10/3} \times \frac{1,500,000}{n}$$

Where:  $L_{10}$  = The # of hours that 90% of identical bearings under ideal conditions will operate at a specific speed and condition before fatigue is expected to occur.

- C90 = 2-Row Basic Dynamic Rating (lbs)  
90,000,000 Revolutions
- P = Constant Equivalent Radial Load (lbs)
- n = Speed (RPM)\*

\* For speeds less than 50 RPM, use 50 RPM when doing L10 calculations.

Note: L10 life does not apply to rod ends and plain spherical bearings due to the sliding motion between components versus a rolling motion. Normal operation of these types of bearings results in wear of the raceways or fatigue or fracture of the outer member. Give consideration to this in the design of the equipment.

## Shock and Vibration

Vibration and shock loading can act as an additional loading to the steady expected applied load. When shock or vibration is present, multiply the theoretical life by the factors below to determine adjusted theoretical life.

Mounted Roller Bearing Shock Vibration Factors	
Steady Loading	1.0
Light Shock / Vibration	0.5
Moderate Shock / Vibration	0.3

Additionally, the ABMA provides application factors for all types of bearings which need to be considered to determine an adjusted Rated Life ( $L_{na}$ ). L10 life rating is based on laboratory conditions yet other factors are encountered in actual bearing application that will reduce bearing life.  $L_{na}$  life rating takes into account reliability factors, material type, and operating conditions.

$$L_{na} = a_1 \times a_2 \times a_3 \times L_{10}$$

Where:

$L_{na}$  = Adjusted Rated Life.

$a_1$  = Reliability Factor. Adjustment factor applied where estimated fatigue life is based on reliability other than 90% (See Table No 1).

$a_2$  = Material Factor. Life adjustment for bearing race

Table No. 1 Life Adjustment Factor for Reliability

Reliability %	$L_{na}$	$a_1$
90	L10	1
95	L5	0.62
96	L4	0.53
97	L3	0.44
98	L2	0.33
99	L1	0.21
50	L50	5

material. Regal Power Transmission Solutions bearing races are manufactured from bearing quality steel. Therefore the  $a_2$  factor is 1.0.

$a_3$  = Life Adjustment Factor for Operating Conditions. This factor should take into account the adequacy of lubricant, presence of foreign matter, conditions causing changes in material properties, and unusual loading or mounting conditions. Assuming a properly selected and mounted bearing having adequate seals and lubricant operating below 250°F and tight fitted to the shaft, the  $a_3$  factor should be 1.0.

# Load Ratings and Life Continued

Mounted bearings are typically “slip fitted” to the shaft and rely on design features such as the inner race length and locking device for support.

Vibration and shock loading can act as an additional loading to the steady expected applied load. When shock or vibration is present, an a<sup>3</sup> Life Adjustment Factor can be applied. Shock loading has many variables which often are not easily determined. Typically, it is best to rely on one’s experience with the particular application. Consult Application Engineering for assistance with applications involving shock or vibration loading.

The a<sup>3</sup> factor takes into account a wide range of application and mounting conditions as well as bearing features and design. Accurate determination of this factor is normally achieved through testing and in-field experience. Regal Power Transmission Solutions offers a wide range of options which can maximize bearing performance. Consult Application Engineering for more information. See sample calculations on page I-54.

## Combined Load – Tapered Roller Bearings

1. Calculate the bearing internal thrust reaction (FIR):

$$FIR = \frac{0.6 \times F}{K} - \text{applied radial load factor K in Table No. 6}$$

2. If the thrust load (Fa) is less than or equal to FIR, then calculate the equivalent radial load as follows:

$$P = (0.5 \times F_r) + (0.83 \times K \times F_a)$$

3. If the thrust load (Fa) is greater than FIR then calculate the equivalent radial load as follows:

$$P = (0.4 \times F_r) + (K \times F_a)$$

4. Calculate the expected L10 life using the single row basic dynamic load rating:

$$L_{10} = \left( \frac{\text{single row load rating}}{P} \right)^{10/3} \times \frac{3000 \times 500}{n}$$

Table No. 2 - Sealmaster RPB and Browning E920 Tapered Roller Bearing Load Ratings

Bore Size		Radial Rating (pounds)		(1) Thrust Rating (pounds)	Factor K	Allowable Thrust on Pillow Block Housing	
inch	mm	2 Row	1 Row			2 Bolt Base	4 Bolt Base
1 3/16 - 1 1/4	-	2975	1710	1390	1.23	960	-

2 11/16 - 3	70 - 75	9630	5510	4260	1.30	3340	5700
3 3/16 - 3 1/2	80 - 95	15320	8790	7410	1.19	4450	10980
3 15/16 - 4	100 - 105	20980	12100	9800	1.23	-	7250
4 7/16 - 4 1/2	110 - 115	25750	14800	13100	1.13	-	6680
4 15/16 - 4 1/2	120 - 125	35520	20400	16000	1.27	-	9000

(1) For thrust load pillow block applications, the bearing thrust rating must be compared to the allowable thrust load capacity of the housing. In a number of sizes, the allowable thrust capacity of the pillow block is less than the thrust rating of the bearing. When this circumstance exists, do not exceed the pillow block housing thrust capacity. In thrust applications utilizing flange or piloted flange housings, please contact application engineering for allowable housing thrust limits.

7 1/2 - 8	363818	587106	.35	1.0	1.9	0.67	2.9	1.0	1.9

3. Calculate equivalent load using the following equation:

$$P = XF_r + YF_a$$

4. Calculate the L10 life using the life equation on page I-48.

# Load Ratings and Life Continued

## Variable Load Formula

Root mean load (RML) is to be used when a number of varying loads are applied to a bearing for varying time limits. Maximum loading still must be considered for bearing size selection.

$$RML^* = \sqrt[10/3]{\frac{(L_1^{10/3} N_1) + (L_2^{10/3} N_2) + (L_3^{10/3} N_3)}{100}}$$

Where,  
 RML = Root Mean Load (lbs.)  
 L1, L2, etc. = Load in pounds  
 N1, N2, etc. = Percent of total time operated at loads L1, L2, etc.

\* Apply RML to rating at mean speed to determine resultant life.

## Mean Speed Formula

The following formula is to be used when operating speed varies over time.

$$\text{Mean Speed} = \frac{S_1 N_1 + S_2 N_2 + S_3 N_3}{100}$$

$S_1, S_2, \text{ etc}$  = Speeds in RPM  
 $N_1, N_2, \text{ etc}$  = Percentage of total time operated at speeds  $S_1, S_2, \text{ etc}$

## Bearing Life In Oscillating Applications

The equivalent rotative speed (ERS) is used in life calculations when the bearing does not make complete revolutions during operation. The ERS is then used as the bearing operating speed in the calculation of the L10 (Rating) Life. The formula is based on sufficient angular rotation to have roller paths overlap.

**ERS = Equivalent Rotative Speed**  
**N = Total number of degrees per minute through which the bearing will rotate.**  

$$ERS = \frac{N}{360}$$

In the above formula, allowance is made for the total number of stress applications on the weakest race per unit time, which, in turn, determines fatigue life and the speed factors. The theory behind fretting corrosion is best explained by the fact that the rolling elements in small angles of oscillation retrace a path over an unchanging area of the inner or outer races where the lubricant is prevented by inertia from flowing in behind the roller as the bearing oscillates in one direction. Upon reversal, this small area of rolling contact is traversed by the same roller in the dry state. The friction of the two unlubricated surfaces causes fretting corrosion and produces failures which are unpredictable from a normal life standpoint.

With a given bearing selected for an oscillating application, the best lubrication means is a light mineral oil under positive flow conditions. With a light oil, there is a tendency for all areas in the bearing load zone to be immersed in lubricant at all times. The full flow lubrication dictates that any oxidized material which may form is immediately carried away by the lubricant, and since these oxides are abrasive, further wear tends to be avoided. If grease lubrication must be used, it is best to consult with either the bearing manufacturer or the lubricant manufacturer to determine the best possible type of lubricant. Greases have been compounded to resist the detrimental effect of fretting corrosion for such applications.

Mtd. Tapered Bearings

## Load Ratings and Life Continued

### Static Load Rating

The “static load rating” for rolling element bearings is that uniformly distributed static radial load acting on a non-rotating bearing, which produces a contact stress of 580,000 psi at the center of the most heavily loaded rolling element. At this stress level, plastic deformation begins to be significant. Experience has shown that the plastic deformation at this stress level can be tolerated in most bearing applications without impairment of subsequent bearing operation. In certain applications where subsequent rotation of the bearing is slow and where smoothness and friction requirements are not too exacting, a higher static load limit can be tolerated. Where extreme smoothness is required or friction requirements are critical, a lower static load limit may be necessary.

# Load Ratings and Life Continued

## Minimum Bearing Load:

Skidding, or sliding, of the rolling elements on the raceway instead of a true rolling motion can cause excessive wear. Applications with high speeds and light loading are particularly prone to skidding. As a general guideline, rolling element bearings should be radially loaded at least 2% of Basic Dynamic Rating for roller bearings. For applications where load is light relative to the bearings dynamic load rating, consult Application Engineering for assistance.

## Computing Bearing Loads

In the computation of bearing loads in any application of an Regal Power Transmission Solutions unit, the principal factor determining the selection of the unit is the equivalent radial load to which the bearing will be subjected. These radial loads result from any one or any combination of the following sources:

1. Weights of machine parts supported by bearings.
2. Tension due to belt or chain pull.
3. Centrifugal force from out of balance, eccentric or cam action.

The resulting load from any one, or any combination of the above sources is further determined by knowing:

1. The magnitude of the load.
2. Direction of the load.
3. The point of load application.
4. The distance between bearing centers.

Bearing loads are the result of force acting on the shaft. Direction, magnitude, and location with respect to the bearings must be considered when calculating bearing loads. The following cases are typical examples of loads encountered and methods of calculating bearing loads.

Mtd. Tapered Bearings

**CASE #1**  
**Drive Load Calculation**

$$P = \frac{126,000 \times \text{HP}}{\text{RPM} \times d} \times K$$

K = Apply P to Case 2, 3 or 4 if applicable  
 HP = horsepower  
 RPM = revolutions per minute  
 d = pitch of pulley in inches  
 K = constant for type of drive used  
 K = 1.5 for V-belts  
 K = 2 to 3 for flat transmission belts  
 K = 1.1 for chain drives

**CASE #2**  
**Cantilever and Drive**

$$\text{Load on Bearing A} = \frac{P_1 \times (a + k) - (P_2 \times b)}{k}$$

$$= \frac{200 \times (4 + 9) - (80 \times 2)}{9}$$

$$= 271 \text{ lbs.}$$

$$\text{Load on Bearing B} = \frac{P_2 \times (k + b) - (P_1 \times a)}{k}$$

$$= \frac{80 \times (9 + 2) - (200 \times 4)}{9}$$

$$= 9 \text{ lbs.}$$

**CASE #3**  
**Straddle, Cantilever Drive**

$$\text{Load on Bearing A} = \frac{P_1 \times (k + a) + (P_2 \times c) - (P_3 \times d)}{k}$$

$$= \frac{60 \times (12 + 2) + (180 \times 6) - (70 \times 4)}{12}$$

$$= 137 \text{ lbs.}$$

$$\text{Load on Bearing B} = \frac{-(P_1 \times a) + (P_2 \times b) + P_3 \times (k + d)}{k}$$

$$= \frac{-(60 \times 2) + (180 \times 6) + 70 \times (12 + 4)}{12}$$

$$= 173 \text{ lbs.}$$

**CASE #4**  
**Straddle Mount, Cantilever Drive**

$$\text{Load on Bearing A} = \frac{(P_1 \times b) - (P_2 \times c)}{k}$$

$$= \frac{(1000 \times 4) - (150 \times 3)}{11}$$

$$= 323 \text{ lbs.}$$

$$\text{Load on Bearing B} = \frac{(P_1 \times a) + (c + k) \times (P_2)}{k}$$

$$= \frac{(1000 \times 7) + (3 + 11) \times (150)}{11}$$

$$= 827 \text{ lbs.}$$

**CASE #5**  
**Vibrating Drives**

Load due to Centrifugal and Inertial Forces - In a shaker or gyrating screen bearing application, the load on the bearings is increased by sudden stopping, starting, and reversing of typically large loads. This can be expressed as a basic physical law:

**Force = Mass x Accelerations**

In order to use this law, we develop from it the following equation:

$$F = .000341 \times W R (\text{RPM})^2$$

Where: F = Load of force in lbs.  
 W = Weight of rotating mass in lbs.  
 R = Radius of rotation or throw in feet  
 RPM = Shaft rotation in revolutions per minute

What is the centrifugal bearing load on a shaker screen which weighs 2,500 lbs., has a throw of 1/4 in. and whose shaft speed is 500 RPM?

$$F = .000341 \times 2,500 \times \frac{.250}{12} \times (500)^2 = 4,440 \text{ lbs.}$$

# Load Ratings and Life Continued

## Mounted Roller Bearing Selection - New Applications:

Using variations of the life formulas and application information, it is possible to select bearings based on desired life, load applied, and shaft speed. **This method is applicable only when thrust load is less than or equal to 1/2 the radial load.**

1. Determine required application hours ( $L_a$ ).
2. Calculate  $L_{10}$  using adjustment factors:

$$L_{10} = \frac{L_a}{a_1 \times a_2 \times a_3}$$

3. Calculate Basic Dynamic Radial Rating ( $C_{req}$ ).

$$C_{req} = P \times \left( \frac{L_{10} \times N}{3,000 \times 500} \right)^{3/10}$$

$P$  = Constant Equivalent Radial Load (lbs)

$N$  = Speed (RPM)

4. Use Table 2 on page I-49, find a basic Dynamic Radial Rating Value greater than or equal to  $C_{req}$  calculated in step # 3.
5. Select any bearing from the row in step # 4 or larger.
6. Proceed with housing, seal, and lock selection pages I-3 to I-5.

Typical operating temperature range for standard bearings is -20° to 200° F for Browning and -20°F to 220°F for Sealmaster Gold. For operating temperatures outside this range, contact Application Engineering. For Maximum speed information, see tables on page I-58.

## Application Examples:

### Question #1:

What is the bearing life ( $L_{10}$  hours) for an RPB207-2 Tapered Roller Bearing with no shock conditions and the following application criteria?

Design Radial Load ( $P$ ) = 5,000 lbs.

Speed ( $n$ ) = 100 RPM

Shaft Size = 2 7/16"

Operating Temperature = 125°F

### Solution:

1. Begin with the  $L_{10}$  life formula:

$$L_{10} = (C/P)^{10/3} \times \frac{500 \times 3,000}{n}$$

2. RPB207-2 has 2 7/16" shaft size. From Table 2 on page I-49, the radial rating is 9,030 lbs.

$$L_{10} = \left( \frac{9,030}{5,000} \right)^{10/3} \times \frac{500 \times 3,000}{100} = 107,601$$

### Question #2:

What is the bearing life ( $L_{10}$  hours) for an USRB5000-207 Spherical Roller Bearing with no shock conditions and the same application criteria?

### Solution:

1. Begin with the  $L_{10}$  life formula:

$$L_{10} = (C/P)^{10/3} \times \frac{16,667}{n}$$

2. USRB5000-207 has 2 7/16" shaft size. From Table 3 on page I-50, the radial rating is 44,691 lbs.

$$L_{10} = \left( \frac{44,691}{5,000} \right)^{10/3} \times \frac{16,667}{100} = 246,997$$

# Load Ratings and Life Continued

## Combined Radial and Thrust Load Application Examples:

### Question #1:

What is the bearing life ( $L_{10}$  hours) for an RPB207-2 Tapered Roller Bearing with no shock conditions and the following application criteria?

- Design Radial Load ( $F_r$ ) = 5,000 lbs.
- Design Thrust Load ( $F_a$ ) = 1,000 lbs.
- Speed ( $n$ ) = 100 RPM
- Shaft Size = 2 7/16"
- Operating Temperature = 125°F

### Solution:

1. Find the K factor value from Table 2 on page I-49,  $K = 1.51$

2. Calculate the internal thrust reaction (FIR):

$$FIR = \frac{0.6 \times F_r}{K} \text{ - applied radial load}$$

- factor K in Table No. 2

$$FIR = \frac{0.6 \times 5000}{1.51} = 1,987 \text{ lbs.}$$

3. Since the thrust load is less than the internal thrust reaction (FIR) use the following formula from page I-49 to calculate the equivalent radial load:

$$P = (0.5 \times F_r) + (.83 \times K \times F_a)$$

$$P = (0.5 \times 5000) + (.83 \times 1.51 \times 1000) = 3,753 \text{ lbs.}$$

4. Calculate the expected  $L_{10}$  life using the single row rating. Single row rating = 5,220 lbs. This is found in Table 2 on page I-49.

$$L_{10} = \left( \frac{\text{single row load rating}}{P} \right)^{10/3} \times \frac{500 \times 3000}{n}$$

$$L_{10} = \left( \frac{5,220}{3,753} \right)^{10/3} \times \frac{500 \times 3000}{100} = 45,054 \text{ hrs.}$$

### Question #2:

What is the bearing life ( $L_{10}$  hours) for an USRB5000-207 Spherical Roller Bearing with no shock conditions and the same application criteria?

### Solution:

1. Calculate  $F_a/F_r$  and compare the value to the "e" value found in Table 3 on page I-50.

$$F_a/F_r = 1,000/5,000 = .20$$

2. Choose values for "x" and "y" based on Step 1 above from Table 3 on page I-50.

3. Calculate the equivalent load.

$$P = (x F_r) + (y F_a)$$

$$= (1 \times 5,000) + (2.2 \times 1000)$$

$$= 7,200 \text{ lbs.}$$

4. Calculate the expected  $L_{10}$  life using the rating from the equation on page I-48.

$$L_{10} = (C/P)^{10/3} \times \frac{16,667}{n}$$

$$= \left( \frac{44,691}{7,200} \right)^{10/3} \times \frac{16,667}{100}$$

$$= 73,251 \text{ hrs.}$$

## Shock Load Considerations

### Question #3:

What is the bearing life ( $L_{10}$  hours) for the bearing in Question #1 and #2 with moderate shock conditions and the same application criteria from above?

### Solution:

1. Calculate the Adjusted Rate Life

$$Lna = a_1 \times a_2 \times a_3 \times L_{10}$$

2. ( $a_1$ ) = Life Adjustment Factor for Reliability = 1.0

3. ( $a_2$ ) = Life Adjustment Factor for Operating Conditions = 1.0

4. ( $a_3$ ) = For moderate shock (from mounted Roller Bearing Shock Vibration Factors Table on page I-48) = 0.5

RPB207-2 Tapered Roller Bearing:

$$L_{10} = .5 \times 45,054 = 22,527 \text{ hrs.}$$

USRB5000-207 Spherical Roller Bearing:

$$L_{10} = .5 \times 73,251 = 36,626 \text{ hrs.}$$

This chart displays the Sealmaster RPB and Browning E920 Series Tapered Roller Bearings load capacity for a given L10 life speed and shaft size. Values in the table represent load at ideal conditions. The shaded areas indicate maximum speed for the Sealmaster RPB series only. For combined load determination, see the Bearing Selection section on page I-49. Areas designated by "-" exceed maximum speed value.

\*Single Row Basic Dynamic Rating required for determining combined loads as shown on page I-49.

### Table 5 - Sealmaster USRB Spherical Roller Bearing Load / Speed Chart

Series	Bore Size	L <sub>10</sub> Hours	Revolutions per Minute																
			50	100	150	250	500	750	1000	1500	1750	2000	2500	3000	3500	4000

This chart displays the Sealmaster Unitized Spherical Roller Bearing (USRB) load capacity for a given L10 life, speed and shaft size. Values in the Table represent estimated load at ideal conditions. The shaded areas indicate maximum speed for USRB felt seals. For combined load determination, see the Bearing Selection section on page I-50. Areas designated by "—" exceed maximum speed value. For actual maximum speed limits see table on page I-58.

# Speed Limit Tables

**Table 6 - Sealmaster RPB Tapered Roller Bearing Maximum Speed Rating**

Maximum Operational Speed*		
Bore Size		Speed (RPM)
inch	mm	
1 3/16 - 1 1/4	-	4000
1 3/8 - 1 7/16	35	3500
1 1/2 - 1 11/16	40	3000
1 3/4 - 2 3/16	45 - 50	2500
2 1/4 - 2 1/2	60 - 65	2000
2 11/16 - 3	70 - 75	1750
3 3/16 - 3 1/2	80 - 95	1500
3 15/16 - 4 1/2	100 - 115	1250
4 15/16 - 5	120 - 125	1000

\* Tapered Roller Bearing maximum speeds are not limited by seals, value listed is for all seal designs.

**Table 7 - Browning E920 Tapered Roller Bearing Maximum Speed Rating**

Maximum Operational Speed	
Bore Size	Speed (RPM)
inch	
1 3/16 - 1 1/4	3500
1 3/8 - 1 7/16	3000
1 1/2 - 1 11/16	2500
1 3/4 - 2 3/16	2000
2 1/4 - 2 1/2	1750
2 11/16 - 3	1500
3 3/16 - 4	1000
4 7/16 - 5	750

**Table 8 - Sealmaster USRB Spherical Roller Bearing Maximum Speed Rating**

Maximum Operational Speed		
Bore Size	Felt Seal (RPM)	Contact Seal (RPM)
inch		
1 1/8 - 1 1/2	4000	3000
1 11/16 - 1 3/4	4000	2750
1 15/16 - 2	4000	2500
2 3/16	3750	2200
2 7/16 - 2 1/2	3250	1750
2 11/16 - 3	3000	1600
3 3/16 - 3 1/2	2500	1350
3 11/16 - 4	2250	1200
4 7/16 - 4 1/2	2000	1100
4 15/16 - 5	1750	900

Values in these tables represent speeds at ideal conditions. Other application factors may reduce the speed rating of a bearing. Seal limits evaluated at a load of c/10.

## Sealmaster RPB Tapered Roller Bearing Installation

### Mounting Lock Collar Units:

#### NOTICE

- These bearings are designed for maximum permissible static misalignment of  $\pm 3$  degrees. Installation, handling or operation of the bearing in excess of the maximum of  $\pm 3$  degrees can cause reduction in bearing performance and may lead to equipment failure.
- Do not strike or hammer on any component of the bearing and/or shaft. Impact can result in damage to the bearing that may cause reduction in bearing performance and may lead to equipment failure.

### Step 1: Inspect Shaft and Bore

Shaft should be within tolerance range shown in Table I, clean and free of nicks and burrs. Mount bearings on unused section of shafting or repair/replace shafting as required. Inspect both the shaft and bearing bore for debris or contaminants. Wipe clean as necessary.

Table I

Recommended Shaft Tolerances	
Nominal Bore Diameter	Tolerance (inch)
1 3/16 - 2	+0.000 / -0.0005
2 3/16 - 4	+0.000 / -0.001
4 7/16 - 5	+0.000 / -0.0015

### Step 2: Check Support Surfaces

Make sure the base of the housing and the support surfaces are clean and free from burrs. If the housing elevation is adjusted with shims these must cover the entire contact area between the housing and the support surface.

### Step 3: Install Unit

To aid installation, keep weight off bearing during mounting. Slide unit onto shaft by pushing on the inner ring. If it is difficult to mount bearing on shaft, use a piece of emery cloth to reduce any high spots on the shaft.

### Step 4: Fasten Unit in Place

Install housing mounting bolts and check bearing alignment. Align the bearing units as closely as possible. Tighten mounting bolts to recommended fastener torques. Check the shaft for freedom of rotation by rotating shaft with hand in both directions.

### Step 5: Position Insert

If expansion units are used, the insert must be located in the housing to allow for axial shaft expansion and/or contraction. Position bearing insert to obtain the required axial expansion in desired directions. It may be necessary to unload the bearing while moving the assembly.

## Installation Instructions continued

### Step 6: Tighten Setscrews

Setscrews in multiple bearing applications should be aligned as shown in Figure 1.

Tighten bearing units to the shaft as follows:

- a) Torque the first setscrew to one half of the recommended torque in Table II.
- b) Torque the second setscrew to the full recommended torque. Go back to the first setscrew and tighten to the full recommended torque.

If the bearing unit has two lock collars, repeat the same procedure for the second lock collar. Check shaft again for freedom of rotation and then tighten the second bearing unit in the same fashion. When all bearings are tightened, perform a final check to the shaft for freedom of rotation.

Figure 1

Table II

Lock Collar Setscrew Torque			
Bore Size		Hex Size	Foot-Pounds
inch	mm		
1 3/16 - 1 11/16	35 - 40	5/32	12
1 3/4 - 2 1/2	45 - 65	3/16	19
2 11/16 - 3 1/2	70 - 95	1/4	43
3 15/16 - 4	100 - 105	5/16	83
4 7/16 - 5	110 - 125	3/8	155

### Replacing Existing Sealmaster Inserts:

**Note:** Replacement Sealmaster bearing inserts are intended for use in Sealmaster housings only.

#### Step 1: Remove Housing Cap Bolts

#### Step 2: Remove Top Half of Housing

#### Step 3: Remove Bearing from Shaft

Loosen the setscrews and slide the bearing off the shaft.

#### Step 4: Inspect Shaft and Bore

Shaft should be within tolerance range shown in Table I, clean and free of nicks and burrs. Mount bearings on unused section of shafting or repair/replace shafting as required. Inspect both the shaft and bearing bore for debris or contaminants. Also be sure to inspect the housing for damages. Wipe housing bore clean as necessary and check that the lubrication hole is clean and free of debris.

### Installation Instructions continued

#### Step 5: Load New Insert

Slide bearing onto shaft and seat the bearing in the housing base.

Table III

Pillow Block Housing		
Bore Size		Housing Cap Tightening Torque (Foot-Pounds)
inch	mm	
1 3/16 - 1 1/4	-	17
1 3/8 - 2 3/16	35 - 55	30
2 1/4 - 3	60 - 75	75
3 3/16 - 4 1/2	80 - 115	265
4 15/16 - 5	120 - 125	390

#### Step 6: Install Top Half of Housing

Check to assure that the rubber grommet is properly seated in the lube hole in the top half of the housing. Position the insert so that the lock pin lines up with the lock pin slot in the top half of the housing. Be sure that the lock pin is not positioned in the lube hole.

Be sure to check the bearing inserts for proper alignment. Align the bearings.

Install the top half of the housing. Tighten down the cap bolts to the recommended torque in Tables III, IV, V, or VI, based on the housing type. Rotate the shaft by hand to check for freedom of rotation.

#### Step 7: Refer to Steps 5 and 6 from the Previous Installation Section

Table IV

Flange Bearing Housing		
Bore Size		Housing Cap Tightening Torque (Foot-Pounds)
inch	mm	
1 3/16 - 2	35 - 50	30
2 3/16 - 3	55 - 75	75
3 3/16 - 4	80 - 105	150

Table V

Mtd. Tapered Bearings

## Sealmaster RPB Tapered Roller Bearing Lubrication:

### Pre-Mounting Checklist:

All Sealmaster RPB Mounted Tapered Roller Bearings are delivered with a high quality lithium complex grease with an EP additive. The bearing is ready for use with no initial lubrication required. The grease consists of a lithium complex thickener, mineral oil, and NLGI grade 2 consistency.

Compatibility of grease is critical; therefore consult with Application Engineering and your grease supplier to insure greases are compatible. For best performance it is recommended to relubricate with lithium complex thickened grease with a comparable NLGI consistency and base oil properties.

Relubricatable Sealmaster bearings are supplied with grease fittings or zerks for ease of lubrication with hand or automatic grease guns. Always wipe the fitting and grease nozzle clean.

**Caution:** If possible, it is recommended to lubricate the bearing while rotating, until grease purge is observed from the seals. If this is not an option due to safety reasons, follow the alternate lubrication procedure below.

### Alternate Lubrication Procedure:

Stop rotating equipment. Add one half the recommended amount shown in Table VII. Start the bearing and run for a few minutes. Stop the bearing and add the second half of the recommended amount. A temperature rise after lubrication, sometimes 30°F (17°C), is normal. Bearing should operate at temperatures less than 200°F (94°C) and should not exceed 250° (121°C) for intermittent operation. For lubrication guidelines, see Tables VIII.

**Note:** Table VIII are general recommendations. Experience and testing may be required for specific applications.

**Note:** Grease charges in Table VII are based on the use of lithium complex thickened grease with a NLGI grade 2 consistency.

### Expansion Bearing Applications:

Before installation, make certain proper expansion is accounted for. Expansion units should be placed in a location where relative movement between the bearing insert and the housing can be tolerated. For most applications using expansion type units, the fixed unit (non-expansion unit) is placed at the drive end of the shaft. Use Table IX to review the total available bearing expansion. If the application requires additional expansion, consult Application Engineering.

Table VII

Grease Charge for Relubrication		
Bore Size		Grease Charge (Mass - Ounces)
inch	mm	
1 3/16 - 1 1/4	-	0.10
1 3/8 - 1 7/16	35	0.20
1 1/2 - 1 11/16	40	0.30

### Browning E920 Tapered Roller Bearing Installation

#### Mounting Lock Collar Units:

#### NOTICE

- Do not strike or hammer on any component of the bearing and/or shaft. Impact can result in damage to the bearing that may cause reduction in bearing performance and may lead to equipment failure.

#### Step 1: Inspect Shaft and Bore

Shaft should be within tolerance range shown in Table I, clean and free of nicks and burrs. Mount bearings on unused section of shafting or repair/replace shafting as required. Inspect both the shaft and bearing bore for debris or contaminants. Wipe clean as necessary.

Table I

Recommended Shaft Tolerances	
Nominal Bore Diameter	Tolerance (inch)
1 3/16 - 2	+0.000 / -0.0005
2 3/16 - 4	+0.000 / -0.001
4 7/16 - 5	+0.000 / -0.0015

#### Step 2: Check Support Surfaces

Make sure the base of the housing and the support surfaces are clean and free from burrs. If the housing elevation is adjusted with shims these must cover the entire contact area between the housing and the support surface.

#### Step 3: Install Unit

To aid installation, keep weight off bearing during mounting. Slide unit onto shaft by pushing on the inner ring. If it is difficult to mount bearing on shaft, use a piece of emery cloth to reduce any high spots on the shaft.

#### Step 4: Fasten Unit in Place

Install housing mounting bolts and check bearing alignment. Align the bearing units as closely as possible.

Tighten mounting bolts to recommended fastener torques. Check the shaft for freedom of rotation by rotating shaft with hand in both directions.

#### Step 5: Tighten Setscrews

Setscrews in multiple bearing applications should be aligned as shown in Figure 1. Tighten bearing units to the shaft as follows:

- Torque the first setscrew to one half of the recommended torque in Table II.
- Torque the second setscrew to the full recommended torque. Go back to the first setscrew and tighten to the full recommended torque.

Repeat the same procedure for the second lock collar. Check shaft again for freedom of rotation and then tighten the second bearing unit in the same fashion. When all bearings are tightened, perform a final check to the shaft for freedom of rotation.

Figure 1

Table II

Lock Collar Setscrew Torque	
Bore Size	Foot-Pounds
1 3/16 - 1 11/16	12
1 3/4 - 2 1/2	19
2 11/16 - 3 1/2	45
3 15/16 - 4	95
4 7/16 - 5	150

## Browning E920 Tapered Roller Bearing Lubrication:

### Pre-Mounting Checklist:

All Browning E920 Tapered Roller Bearings are delivered with a high quality lithium grease with an EP additive. The bearing is ready for use with no initial lubrication required. The grease consists of a lithium thickener, mineral oil, and NLGI grade 2 consistency.

Compatibility of grease is critical; therefore consult with Application Engineering and your grease supplier to insure greases are compatible. For best performance it is recommended to relubricate with lithium thickened grease with a comparable NLGI consistency and base oil properties.

Relubricatable Browning bearings are supplied with grease fittings or zerks for ease of lubrication with hand or automatic grease guns. Always wipe the fitting and grease nozzle clean.

**CAUTION:** If possible, it is recommended to lubricate the bearing while rotating, until grease purge is observed from the seals. If this is not an option due to safety reasons, follow the alternate lubrication procedure below.

### Alternate Lubrication Procedure:

Stop rotating equipment. Add one half of the recommended amount shown in Table III. Start the bearing and run for a few minutes. Stop the bearing and add the second half of the recommended amount. A temperature rise after lubrication, sometimes 30°F (17°C), is normal. Bearing should operate at temperatures less than 200°F (94°C) and should not exceed 250° (121°C) for intermittent operation. For lubrication guidelines, see Table IV.

**Note:** Table IV are general recommendations. Experience and testing may be required for specific applications.

**Note:** Grease charges in Table III are based on the use of lithium thickened grease with a NLGI grade 2 consistency.

Table III

Grease Charge for Relubrication	
Bore Size	Grease Charge (Mass - Ounces)
1 3/16 - 1 1/4	0.26
1 3/8 - 1 7/16	0.30
1 1/2 - 1 11/16	0.36
1 3/4 - 2	0.42
2 3/16	0.69
2 1/4 - 2 1/2	0.75
2 11/16 - 3	0.92
3 3/16 - 3 1/2	1.50
3 15/16 - 4	1.92
4 7/16 - 4 1/2	2.79
4 15/16 - 5	4.17

Table IV

Relubrication Recommendations			
Environment	Temperature (°F)	Speed (% Catalog Max)	Frequency
Dirty	-20 to 250	0 - 100%	Daily to 1 Week
Clean	-20 to 125	0 - 25%	4 to 10 Months
		26 - 50%	1 to 4 Months
		51 - 75%	1 Week to 1 Month
		76 - 100%	Daily to 1 Week
	125 to 175	0 - 25%	2 to 6 Weeks
		26 - 50%	1 Week to 1 Month
		51 - 75%	Daily to 1 Week
		76 - 100%	
175 to 250	0 - 100%	Daily to 1 Week	

Table V

Maximum Operational Speed	
Bore Size	Speed (RPM)
1 3/16 - 1 1/4	3500
1 3/8 - 1 7/16	3000
1 1/2 - 1 11/16	2500
1 3/4 - 2 3/16	2000
2 1/4 - 2 1/2	1750
2 11/16 - 3	1500
3 3/16 - 4	1000
4 7/16 - 5	750

## Sealmaster USRB Spherical Roller Bearing Installation

### Mounting Lock Collar Units:

#### NOTICE

- These bearings are designed for maximum permissible misalignment of  $\pm 2$  degrees. Installation, handling or operation of the bearing in excess of the maximum of  $\pm 2$  degrees can cause reduction in bearing performance and may lead to equipment failure.
- Do not strike or hammer on any component of the bearing and/or shaft. Impact can result in damage to the bearing that may cause reduction in bearing performance and may lead to equipment failure.

#### Step 1: Inspect Shaft and Bore

Shaft should be within tolerance range shown in Table I, clean and free of nicks and burrs. Mount bearings on unused section of shafting or repair/replace shafting as required. Inspect both the shaft and bearing bore for debris or contaminants. Wipe clean as necessary.

Table I

Recommended Shaft Tolerances	
Nominal Bore Diameter	Tolerance (inch)
1 1/8 - 2	+0.000 / -0.0005
2 3/16 - 4	+0.000 / -0.001
4 7/16 - 5	+0.000 / -0.0015

#### Step 2: Check Support Surfaces

Make sure the base of the housing and the support surfaces are clean and free from burrs. If the housing elevation is adjusted with shims these must cover the entire contact area between the housing and the support surface.

#### Step 3: Install Unit

To aid installation, keep weight off bearing during mounting. Slide unit onto shaft by pushing on the inner ring. If it is difficult to mount bearing on shaft, use a piece of emery cloth to reduce any high spots on the shaft.

#### Step 4: Fasten Unit in Place

Install housing mounting bolts and check bearing alignment. Align the bearing units as closely as possible.

Tighten mounting bolts to recommended fastener torques. Check the shaft for freedom of rotation by rotating shaft with hand in both directions.

#### Step 5: Position Insert

If expansion units are used, the insert must be located in the housing to allow for axial shaft expansion and/or contraction. Position bearing insert to obtain the required axial expansion in desired directions. It may be necessary to unload the bearing while moving the assembly.

## Installation Instructions continued

### Step 6: Tighten Setscrews

Setscrews in multiple bearing applications should be aligned as shown in Figure 1. Tighten bearing units to the shaft as follows:

- a) Torque the first setscrew to one half of the recommended torque in Table II.
- b) Torque the second setscrew to the full recommended torque. Go back to the first setscrew and tighten to the full recommended torque.

Figure 1

Table II

Lock Collar Setscrew Torque		
Bore Size	Hex Size	Foot-Pounds
1 1/8 - 1 3/4	5/32	14
1 15/16 - 2 1/2	3/16	25
2 11/16 - 3 1/2	1/4	55
3 11/16 - 4 1/2	5/16	120
4 15/16	3/8	180

If the bearing unit has two lock collars, repeat the same procedure for the second lock collar. Check shaft again for freedom of rotation and then tighten the second bearing unit in the same fashion. When all bearings are tightened, perform a final check to the shaft for freedom of rotation.

### Mounting Adapter Lock Units:

#### Step 1: Inspect Shaft and Bore

Shaft should be within tolerance range shown in Table I, clean and free of nicks and burrs. Mount bearings on unused section of shafting or repair/replace shafting as required. Inspect both the shaft and bearing bore for debris or contaminants. Wipe clean as necessary.

**NOTICE:** Do not apply any additional lubricant (ex. Grease, oil, or anti-seize) to bearing tapered surfaces, bore or shafting. Bearing components have a light oil, rust preventative coating that should not be removed. Application of additional lubricant may cause reduction in bearing performance and may lead to equipment failure.

Table III

Recommended Shaft Tolerances (Adapter Lock)	
Nominal Bore Diameter	Tolerance (inch)
1 1/8 - 2	+0.000 / -0.003
2 3/16 - 4	+0.000 / -0.004
4 7/16 - 5	+0.000 / -0.005

#### Step 2: Check Support Surfaces

Make sure the base of the housing and the support surfaces are clean and free from burrs. If the housing elevation is adjusted with shims these must cover the entire contact area between the housing and the support surface.

#### Step 3: Install Unit

**NOTICE:** One expansion unit is to be used in conjunction with one non-expansion unit for applications using adapter lock units. Failure to utilize one expansion and one non-expansion unit is likely to result in reduced bearing performance.

To aid installation, keep weight off bearing during mounting. Slide unit onto shaft by pushing on the inner ring. If it is difficult to mount bearing on shaft, use a piece of emery cloth to reduce any high spots on the shaft.

## Installation Instructions continued

### Step 4: Fasten Unit in Place

Install housing mounting bolts and check bearing alignment. Align the bearing units as closely as possible.

Tighten mounting bolts to recommended fastener torques. Check the shaft for freedom of rotation by rotating shaft with hand in both directions.

### Step 5: Position Insert

Expansion inserts must be located in the housing to allow for axial shaft expansion and/or contraction. If the direction of shaft expansion or contraction is in the direction shown in Figure 2, locate the bearing insert as shown. If the direction of shaft expansion or contraction is opposite to that shown in Figure 2, center the insert in the housing.

Figure 2

### Step 6: Tighten Cap Screws

Tighten bearing units to the shaft as follows:

- Tighten the cap screws in the specified order, as shown in Figure 3. Continue tightening until all cap screws have become snug.
- Using a torque wrench, tighten each cap screw in the specified order to one half of the recommended torque in Table IV.
- In the same order, repeat the procedure tightening each cap screw to the full recommended torque. Once complete, follow the same pattern and verify that each cap screw has met the full recommended torque value and all cap screws have achieved equivalent resistance.

Check shaft for freedom of rotation and then tighten the second bearing unit in the same fashion. When all bearings are tightened, perform a final check to the shaft for freedom of rotation.

Figure 3

Table IV

Adapter Lock Cap Screw Information			
Bore Size	Torque (inch - Pounds)	Hex Size	# Cap Screws
1 1/8 - 1 1/2	45	1/8	3
1 11/16 - 1 3/4	40	1/8	3
1 15/16 - 2	30	1/8	3
2 3/16	45	1/8	3
2 7/16 - 2 1/2	60	1/8	4
2 11/16 - 3	55	1/8	4
3 3/16 - 3 1/2	80	3/16	4
3 11/16 - 4	80	3/16	4
4 7/16 - 4 1/2	115	3/16	4
4 15/16 - 5	130	3/16	6

## Installation Instructions continued

### Replacing Existing Sealmaster Inserts:

#### Step 1: Loosen and Remove Housing Mounting Bolts

#### Step 2: Remove Bearing from Shaft

For lock collar units, loosen the setscrews. For adapter lock units, loosen the cap screws in the specified order as shown in Figure 3. Once locking mechanism is loosened, slide the bearing off the shaft.

#### Step 3: Remove the Bearing Insert from the Housing

Carefully remove retaining ring and spacer (non-expansion units) from the housing bore. Clean rings before reuse. Remove insert from housing.

#### Step 4: Inspect and Prepare Housing

Housings should be inspected for damage prior to installation. Wipe housing bore clean as necessary and check that the lubrication hole is clean and free of debris. Wetting of the housing bore with oil or grease may be done to ease installation of bearing insert.

#### Step 5: Load New Insert

Slide the bearing insert into the housing.

#### Step 6: Secure Bearing in Housing

Replace the spacer into housing (non-expansion units only). Install retaining rings into the grooves in the housing bore.

#### Step 7: Refer to Steps 1 - 6 from the Previous Installation Sections for the Respective Locking Mechanism

### Sealmaster USRB Spherical Roller Bearing Lubrication:

#### Pre-Mounting Checklist:

All Sealmaster Spherical Roller Bearings are delivered with a high quality lithium complex grease with an EP additive. The bearing is ready for use with no initial lubrication required. The grease consists of a lithium complex thickener, mineral oil, and NLGI grade 2 consistency.

Compatibility of grease is critical; therefore consult with Application Engineering and your grease supplier to insure greases are compatible. For best performance it is recommended to relubricate with lithium complex thickened grease with a comparable NLGI consistency and base oil properties.

Relubricatable Sealmaster bearings are supplied with grease fittings or zerks for ease of lubrication with hand or automatic grease guns. Always wipe the fitting and grease nozzle clean.

**Caution:** If possible, it is recommended to lubricate the bearing while rotating, until grease purge is observed from the seals. If this is not an option due to safety reasons, follow the alternate lubrication procedure below.

### Installation Instructions continued

#### Alternate Lubrication Procedure:

Stop rotating equipment. Add one half the recommended amount shown in Table V. Start the bearing and run for a few minutes. Stop the bearing and add the second half of the recommended amount. A temperature rise after lubrication, sometimes 30°F (17°C), is normal. Bearing should operate at temperatures less than 200°F (94°C) and should not exceed 250° (121°C) for intermittent operation. For lubrication guidelines, see Table VI.

**Note:** Table VI are general recommendations. Experience and testing may be required for specific applications.

**Note:** Grease charges in Table V are based on the use of lithium complex thickened grease with a NLGI grade 2 consistency.

#### Expansion Bearing Applications:

Before installation, make certain proper expansion is accounted for. Expansion units should be placed in a location where relative movement between the bearing insert and the housing can be tolerated. For most applications using expansion type units, the fixed unit (non-expansion unit) is placed at the drive end of the shaft. Use Table VIII to review the total available bearing expansion. If the application requires additional expansion, consult Application Engineering.

**NOTICE:** One expansion unit is to be used in conjunction with one non-expansion unit for applications using adapter lock units. Failure to utilize one expansion and one non-expansion unit is likely to result in reduced bearing performance.

**Table V**

Grease Charge for Relubrication	
Bore Size	Grease Charge (Mass - Ounces)
1 1/8 - 1 1/2	0.20
1 11/16 - 1 3/4	0.20
1 15/16 - 2	0.25
2 3/16	0.40

Mtd. Tapered Bearings

## Sealmaster USRB Spherical Roller Bearing Split Pillow Block Housing Installation

### Mounting Lock Collar Units:

#### NOTICE

- These bearings are designed for maximum permissible misalignment of  $\pm 2$  degrees. Installation, handling or operation of the bearing in excess of the maximum of  $\pm 2$  degrees can cause reduction in bearing performance and may lead to equipment failure.
- Do not strike or hammer on any component of the bearing and/or shaft. Impact can result in damage to the bearing that may cause reduction in bearing performance and may lead to equipment failure.

### Step 1: Inspect Shaft and Bore

Shaft should be within tolerance range shown in Table I, clean and free of nicks and burrs. Mount bearings on unused section of shafting or repair/replace shafting as required. Inspect both the shaft and bearing bore for debris or contaminants. Wipe clean as necessary.

Table I

Recommended Shaft Tolerances	
Nominal Bore Diameter	Tolerance (inch)
1 7/16 - 2	+0.0000 / -0.0005
2 7/16 - 4	+0.000 / -0.001
4 7/16 - 5 15/16	+0.0000 / -0.0015
6 7/16 - 7	+0.000 / -0.002

### Step 2: Check Support Surfaces

Make sure the base of the housing and the support surfaces are clean and free from burrs. If the housing elevation is adjusted with shims these must cover the entire contact area between the housing and the support surface.

### Step 3: Install Unit

To aid installation, keep weight off bearing during mounting. Slide unit onto shaft by pushing on the inner ring. If it is difficult to mount bearing on shaft, use a piece of emery cloth to reduce any high spots on the shaft.

### Step 4: Fasten Unit in Place

Install housing mounting bolts and check bearing alignment. Align the bearing units as closely as possible.

Tighten mounting bolts to recommended fastener torques. Check the shaft for freedom of rotation by rotating shaft with hand in both directions.

### Step 5: Position Insert

Expansion units must be located in the housing to allow for axial shaft expansion and/or contraction. Position bearing insert to obtain the required axial expansion in desired directions. It may be necessary to unload the bearing while moving the assembly.

### Installation Instructions continued

#### Step 6: Tighten Setscrews

Setscrews in multiple bearing applications should be aligned as shown in Figure 1. Tighten bearing units to the shaft as follows:

- a) Torque the first setscrew to one half of the recommended torque in Table II.
- b) Torque the second setscrew to the full recommended torque. Go back to the first setscrew and tighten to the full recommended torque.

If the bearing unit has two lock collars, repeat the same procedure for the second lock collar. Check shaft again for freedom of rotation and then tighten the second bearing unit in the same fashion. When all bearings are tightened, perform a final check to the shaft for freedom of rotation.

Figure 1

Table II

Lock Collar Setscrew Torque		
Bore Size	Hex Size	Foot-Pounds
1 7/16 - 1 3/4	5/32	14
1 15/16 - 2 1/2	3/16	25
2 15/16 - 3 1/2	1/4	55
3 15/16 - 4 1/2	5/16	120
4 15/16 - 5 15/16	3/8	180
6 7/16 - 7	1/2	428

#### Mounting Adapter Lock Units:

##### Step 1: Inspect Shaft and Bore

Shaft should be within tolerance range shown in Table III, clean and free of nicks and burrs. Mount bearings on unused section of shafting or repair/replace shafting as required. Inspect both the shaft and bearing bore for debris or contaminants. Wipe clean as necessary.

**NOTICE:** Do not apply any additional lubricant (ex. Grease, oil, or anti-seize) to bearing tapered surfaces, bore or shafting. Bearing components have a light oil, rust preventative coating that should not be removed. Application of additional lubricant may cause reduction in bearing performance and may lead to equipment failure.

Table III

Recommended Shaft Tolerances	
Nominal Bore Diameter	Tolerance (inch)
1 7/16 - 2	+0.000 / -0.003
2 7/16 - 4	+0.000 / -0.004
4 7/16 - 5 15/16	+0.000 / -0.005
6 7/16 - 8	+0.000 / -0.006

##### Step 2: Check Support Surfaces

Make sure the base of the housing and the support surfaces are clean and free from burrs. If the housing elevation is adjusted with shims these must cover the entire contact area between the housing and the support surface.

##### Step 3: Install Unit

**NOTICE:** One expansion unit is to be used in conjunction with one non-expansion unit for applications using adapter lock units. Failure to utilize one expansion and one non-expansion unit is likely to result in reduced bearing performance.

## Installation Instructions continued

To aid installation, keep weight off bearing during mounting. Slide unit onto shaft by pushing on the inner ring. If it is difficult to mount bearing on shaft, use a piece of emery cloth to reduce any high spots on the shaft.

### Step 4: Fasten Unit in Place

Install housing mounting bolts and check bearing alignment. Align the bearing units as closely as possible.

Tighten mounting bolts to recommended fastener torques. Check the shaft for freedom of rotation by rotating shaft with hand in both directions.

### Step 5: Position Insert

Expansion inserts must be located in the housing to allow for axial shaft expansion and/or contraction. If the direction of shaft expansion or contraction is in the direction shown in Figure 2, locate the bearing insert as shown. If the direction of shaft expansion or contraction is opposite to that shown in Figure 2, center the insert in the housing.

### Step 6: Tighten Cap Screws

Tighten bearing units to the shaft as follows:

- Tighten the cap screws in the specified order, as shown in Figure 3. Continue tightening until all cap screws have become snug.
- Using a torque wrench, tighten each cap screw in the specified order to one half of the recommended torque in Table IV.
- In the same order, repeat the procedure tightening each cap screw to the full recommended torque. Once complete, follow the same pattern and verify that each cap screw has met the full recommended torque value and all cap screws have achieved equivalent resistance.

Check shaft for freedom of rotation and then tighten the second bearing unit in the same fashion. When all bearings are tightened, perform a final check to the shaft for freedom of rotation.

Figure 3

Table IV

Adapter Lock Cap Screw Information			
Bore Size	Torque (inch - Pounds)	Hex Size	# Cap Screws
1 7/16 - 1 1/2	45	1/8	3
1 15/16 - 2	30	1/8	3
2 7/16 - 2 1/2	60	1/8	4
2 15/16 - 3	55	1/8	4
3 7/16 - 3 1/2	80	3/16	4
3 15/16 - 4	80	3/16	4
4 7/16 - 4 1/2	115	3/16	4
4 15/16 - 5	130	3/16	6
5 7/16 - 5 1/2	115	3/16	6
5 15/16	175	3/16	8
6 7/16 - 7	225	1/4	8
7 1/2 - 8	275	1/4	8

## Installation Instructions continued

### Replacing Existing Sealmaster Inserts:

#### Step 1: Remove Housing Cap Bolts

#### Step 2: Remove Top Half of Housing

#### Step 3: Remove Bearing from Shaft

For lock collar units, loosen the setscrews. For adapter lock units, loosen the cap screws in the specified order as shown in Figure 3. Once locking mechanism is loosened, slide the bearing off the shaft.

#### Step 4: Inspect Shaft and Bore

Shaft should be within tolerance range shown in Table III, clean and free of nicks and burrs. Mount bearings on unused section of shafting or repair/replace shafting as required. Inspect both the shaft and bearing bore for debris or contaminants. Also be sure to inspect the housing for damages. Wipe housing bore clean as necessary and check that the lubrication hole is clean and free of debris.

#### Step 5: Load New Insert

Slide bearing onto shaft and seat the bearing in the housing base.

#### Step 6: Install Top Half of Housing

Be sure to check the bearing inserts for proper alignment. Align the bearings.

Install the top half of the housing. Tighten down the cap bolts to the recommended torque in Tables V. Rotate the shaft by hand to check for freedom of rotation.

Table V

Cap Bolt Tightening Torque		
Casting	Bore Size	Foot-Pounds
509	1 7/16 - 1 1/2	31
511	1 15/16 - 2	31
515	2 7/16 - 2 1/2	75
517	2 15/16 - 3	75
520	3 7/16 - 3 1/2	109
522	3 15/16 - 4	150
526	4 7/16 - 4 1/2	150
528	4 15/16 - 5	266
532	5 7/16 - 5 1/2	266
534	5 15/16	266
536	6 7/16 - 6 1/2	266
538	6 15/16 - 7	600
544	7 1/2 - 8	600

### Step 7: Refer to Steps 5 and 6 from the Previous Installation Sections for the Respective Locking Mechanism

### Sealmaster USBR Spherical Roller Bearing Split Pillow Block Housing Lubrication:

#### Pre-Mounting Checklist:

##### Lubrication:

All Sealmaster Spherical Roller Bearings are delivered with a high quality lithium complex grease with an EP additive. The bearing is ready for use with no initial lubrication required. The grease consists of a lithium complex thickener, mineral oil, and NLGI grade 2 consistency.

Compatibility of grease is critical; therefore consult with Application Engineering and your grease supplier to insure greases are compatible. For best performance it is recommended to relubricate with lithium complex thickened grease with a comparable NLGI consistency and base oil properties.

Relubricatable Sealmaster bearings are supplied with

## Installation Instructions continued

grease fittings or zerks for ease of lubrication with hand or automatic grease guns. Always wipe the fitting and grease nozzle clean.

**Caution:** If possible, it is recommended to lubricate the bearing while rotating, until grease purge is observed from the seals. If this is not an option due to safety reasons, follow the alternate lubrication procedure below.

### Alternate Lubrication Procedure:

Stop rotating equipment. Add one half the recommended amount shown in Table VI. Start the bearing and run for a few minutes. Stop the bearing and add the second half of the recommended amount. A temperature rise after lubrication, sometimes 30°F (17°C), is normal. Bearing should operate at temperatures less than 200°F (94°C) and should not exceed 250° (121°C) for intermittent operation. For lubrication guidelines, see Table VII.

**Note:** Table VII are general recommendations. Experience and testing may be required for specific applications.

**Note:** Grease charges in Table VI are based on the use of lithium complex thickened grease with a NLGI grade 2 consistency.

### Expansion Bearing Applications:

Before installation, make certain proper expansion is accounted for. Expansion units should be placed in a location where relative movement between the bearing insert and the housing can be tolerated. For most applications using expansion type units, the fixed unit (non-expansion unit) is placed at the drive end of the shaft. Use Table IX to review the total available bearing expansion. If the application requires additional expansion, consult Application Engineering.

**NOTICE:** One expansion unit is to be used in conjunction with one non-expansion unit for applications using adapter lock units. Failure to utilize one expansion and one non-expansion unit is likely to result in reduced bearing performance.

Table VI

Grease Charge for Relubrication	
Bore Size	Grease Charge (Mass - Ounces)
1 7/16 - 1 1/2	0.20
1 15/16 - 2	0.30
2 7/16 - 2 1/2	0.60
2 15/16 - 3	0.80
3 7/16 - 3 1/2	1.20

## Vibration Analysis

The following equations are used to calculate the fundamental frequencies for Mounted Tapered Roller Bearings.

1. All information can be linked to three factors:
  - Shaft Size
  - Unit number
  - Insert number
2. Use the information from Step 1 to select the vibration geometry information (R, I, O and F) from the Table 9.
3. Use the information to calculate the fundamental bearing frequencies:
  - Roller Spin Frequency (Hz) = R x RPM
  - Inner Roller Pass Frequency (Hz) = I x RPM
  - Outer Roller Pass Frequency (Hz) = O x RPM
  - Fundamental Train Frequency (Hz) = F x RPM

Mtd. Tapered Bearings

## Bearing Symbols for Vibration Analysis

- RPM = Shaft Speed (Revolutions per Minute)
- R = Roller Spin Frequency Factor
- I = Inner Roller Pass Frequency Factor
- O = Outer Roller Pass Frequency Factor
- F = Fundamental Train Frequency Factor

# ***Rod Ends and Spherical Plain Bearings***

Rod ends and spherical plain bearings are designed to support a load, accommodate angular motion, misalignment and oscillation in mechanical motion systems. Rod ends consist of a threaded housing with an integral spherical plain bearing or a threaded housing formed around a ball. Spherical plain bearings consist of an outer race and hardened spherical ball. Spherical plain bearings provide a similar function as rod ends and require housing support.

## **Bearing Configurations**

Male And Female Thread Types In Right And Left Hand Threads With The Option Of Grease Fittings.

## **Mounting Requirements**

Light Press Or Mechanical Fit, Threaded Rod.

## **Bore Size Range**

3/16" To 2"

## **Materials Housing & Balls**

Carbon Steel, Alloy Steel, Stainless Steel

## **Races**

Carbon Steel, Bronze, Delrin<sup>\*</sup>, Stainless And PTFE Liners

## Sealmaster Rod Ends Bearings

Sealmaster two and three piece rod end bearing housing designs have been optimized for overall strength. This housing advantage and variety of outer race materials including brass, steel, DELRIN\*, and PTFE liners provide a wide selection of application solutions. Sealmaster rod end bearings can be joined together or connected with a threaded rod or tube as linkage assemblies for flexibility in motion transfer. In addition Sealmaster rod end bearings can accommodate angular misalignment to provide ease in assembly and smooth motion transfer in a variety of applications.

## Features and Benefits

### Three-Piece Rod Ends

Sealmaster three-piece rod ends incorporate a one-piece race formed around a hardened steel chrome plated ball in a controlled manufacturing process. Three-piece construction offers flexibility for alternative race materials designed to help solve specific application problems. Consult Application Engineering for material combinations available to meet your application needs.

#### Machined Steel Housing

- Protective coated for corrosion resistance
- Higher average tensile strength and fatigue life vs. competition
- Wrench flat on female rod ends facilitates assembly
- Full catalog thread depth for maximum thread engagement

#### One-piece Race

- Reduces pound-out in applications with high frequency oscillation, vibration or shock loading
- Improved spherical ball-race conformity for even load distribution
- Precision ball-race fit
- Less wear than rod ends with two-piece race designs
- Manufactured in steel, aluminum bronze and self lubricating Delrin®

#### Ball

- Alloy steel heat treated and chrome plated for corrosion resistance
- Better wear resistance properties than carbon steel tin nickel plated balls

### Two-Piece Rod Ends

Sealmaster two-piece design rod ends consist of a machined housing formed around a hardened steel chrome plated ball. This construction offers more load capacity than three-piece designs with like housing materials because of greater housing cross section.

#### Machined Steel Housing

- Protective coated for corrosion resistance
- Wrench flat on female rod ends facilitates assembly

#### Ball

- Alloy steel, heat treated, chrome plated for wear resistance properties

## Multiple Configurations

AR

ARE

ARE-N

### Sealmaster AR, ARE and ARE-20N Precision Series Extra Capacity Rod Ends

- Three-piece design rod ends with heat treated alloy steel housing for high static, radial loads. The construction also helps reduce "pound-out" in applications with high frequency oscillation, vibration or shock loading.
- One-piece carbon steel outer race with protective coating for corrosion resistance
- Alloy steel, heat treated, chrome plated ball for wear resistance properties
- Wrench flat on female rod ends facilitates assembly
- Bore sizes form 3/16" to 3/4"
- Grease fittings available on 1/4" through 3/4" bore sizes
- Male and female versions with right and left hand threads
- The ARE-20N Series offers an oversized shank for additional shank strength

CFF-T

CFM-T

### Sealmaster CFF-T and CFM-T Precision Two Piece Rod Ends

- Two piece construction with self-lubricating PTFE liner for applications where grease lubrication is not practical or desirable
- Manufactured with consistent, no load, rotational torque values for accurate linkage control
- Machined carbon steel housings with protective coating for corrosion resistance
- Alloy steel, heat treated, chrome plated ball for wear resistance properties
- Wrench flat on female rod ends facilitates assembly
- Bore sizes form 3/16" to 3/4"
- Male and female versions with right and left hand threads

TR

TRE

### Sealmaster TR and TRE Precision Series Rod Ends

- Three-piece construction to help reduce "pound-out" in applications with high frequency oscillation, vibration or shock loading
- One-piece carbon steel outer race with protective coating for corrosion resistance
- Alloy steel, heat treated, chrome plated ball for wear resistance properties
- Wrench flat on female rod ends facilitates assembly
- Bore sizes from 3/16" to 1"
- Grease fittings available on 1/4" through 1" bore sizes
- Male and female versions in both right and left hand threads

## Multiple Configurations continued

### Sealmaster TF/TM, CFF/CFM, CTFD, CTMD Commercial Series Rod Ends

- Two and three-piece design
- Variety of material and construction combinations
- Machined carbon steel housings with protective coating for corrosion resistance
- Alloy steel, heat treated, chrome plated ball for wear resistance properties
- Wrench flat on female rod ends facilitates assembly
- Bore sizes from 3/16" to 3/4"
- Grease fitting available on CFF/CFM and TF/TM series in 1/4" through 3/4" bore sizes
- Male and female versions in both right and left hand threads

TF

TM

#### TF and TM

- TF and TM series is designed with one-piece bronze race for lower coefficient of friction.

CFF

CFM

#### CFF and CFM

- CFF and CFM series with two piece construction has a greater housing cross section and increased load capacity than three piece rod ends with like housing materials.
- The commercial CFF, CFM series provides a lower cost alternative to the precision grade three piece rod ends with like housing material.

CTFD

CTMD

#### CTFD and CTMD

- CTFD and CTMD series with self-lubricating Delrin\* race for light duty applications where oil and grease should be avoided.
- The rod end utilizes a DELRIN acetal resin race material with lower coefficient of friction than metal to metal versions.
- Delrin material withstands vibration without galling or fretting and absorbs little moisture compared to bearings with nylon races.

\* The following trade names, trademarks and/or registered trademarks are used in this material by Regal Power Transmission Solutions are NOT owned or controlled by Regal Power Transmission Solutions and are believed to be owned by the following parties: Delrin; E.I. du Pont de Nemours and Company. Regal Power Transmission Solutions cannot and does not represent or warrant the accuracy of this information.

## Multiple Configurations continued

CFF-Y

### Sealmaster Rod Ends with Y-Studs

- Y-studs are available on Sealmaster TR/TRE, TR-N/TRE-N, CFF/CFM, CFF-N/CFM-N and CTFD/CTMD rod ends bore sizes from 3/16" to 3/4".
- They are designed to facilitate right angle connections and accommodates up to  $\pm 25$  degrees of angular misalignment in any direction.
- The Y-stud contains a hex wrench flat to facilitate assembly advantages and are manufactured from carbon steel and plated for corrosion protection.
- Caution when selecting rod ends with Y-studs: Catalog load ratings are not applicable with Y-studs because of the reduced stud strength due to bending. For load ratings with Y-stud contact Application Engineering.

## Design Modifications

Sealmaster rod ends can be ordered with the following design modifications at an extra cost.

Stock Modifications	Design Modifications	Option Offered on These Series	Ordering Instructions and Example for Specifying
	Zerk Type Fitting	AR, ARE, ARE-20, TR, TRE, TF, TM, CFF, CFM	Add "N" to part number suffix Example: TRE-8N (available on sizes 4-16 only) Caution: Catalog load ratings of rod ends are not applicable when grease fittings are specified, because of the reduced cross section of the head. When selecting rod ends with grease fittings, consult Application Engineering for static load capacities.
	Y-Studs	TR, TRE, TF, TM, CFF, CFM, CFF-T, CFM-T, CTFD, CTMD	Add "Y" to part number suffix Example: TRE-8Y (see page J-37 for stud specifications) Caution when selecting rod ends with Y-studs: Catalog load ratings are not applicable with Y-studs because of the reduced stud strength due to bending. For load ratings with Y-stud contact Application Engineering.
Special Modifications	Design Modifications	Option Offered on These Series	Ordering Instructions and Example for Specifying
	Alloy Steel Race	AR, ARE, ARE-20, TR, TRE	Add "S" to part number suffix Example ARE-8S
	Stainless Steel Race	AR, ARE, ARE-20, TR, TRE	Add "SS" to part number suffix Example TRE-6SS

# Rod End Bearings **SEALMASTER**®

**Basic Construction Type:** Female 3 pc. Extra Capacity, Precision

**Outer Member Material:** Alloy Steel, Heat Treated Protective Plating for Corrosion Resistance

**Race Material:** Carbon Steel with Protective Plating for Corrosion Resistance

**Ball Material:** Alloy Steel, Heat Treated, Chrome Plated

**NOTES**

1. Rod ends with Zerk type grease fittings can be obtained by ordering the AR-N series; Example: AR-8N.
2. Grease fittings are available on sizes 4 through 12 only.
- \*3. Load ratings apply to the AR series only. For AR-N load ratings contact Application Engineering.
4. To order left hand threaded units add letter "L" to part number prefix; Example: ARL-8.
5. For design modifications, see page J-13.

Metric dimensions for reference only.  
 Not all parts are available from stock. Please contact customer service for availability (800) 626-2120.  
 For more information on bearing capabilities outside of our standard offering, please contact Application Engineering (800) 626-2093.

# Rod End Bearings **SEALMASTER**®

**Basic Construction Type:** Male 2 pc. General Purpose, Commercial

**Outer Member Material:** Carbon Steel with Protective Plating for Corrosion Resistance

**Ball Material:** Alloy Steel, Heat Treated, Chrome Plated

## CFM, CFM-N Series Male Rod Ends

- NOTES
1. Rod ends with Zerk type grease fittings can be obtained by ordering the CFM-N series; Example: CFM-8N.
  2. Grease fittings are available on sizes 4 through 16 only.
  - \*3. Load ratings apply to the CFM series only. For CFM-N load ratings contact Application Engineering.
  4. To order left hand threaded units add letter "L" to part number prefix; Example: CFML-8.
  5. Add letter "Y" to the part number suffix to indicate stud; Example: CFM-8Y.
  6. For design modifications, see page J-13.

- Basic Construction Type:** Female 3 pc. General Purpose, Commercial
- Outer Member Material:** Carbon Steel with Protective Plating for Corrosion Resistance
- Race Material:** Delrin\*
- Ball Material:** Alloy Steel, Heat Treated, Chrome Plated
- Feature:** Self-Lubricating

## Sealmaster Spherical Plain Bearings

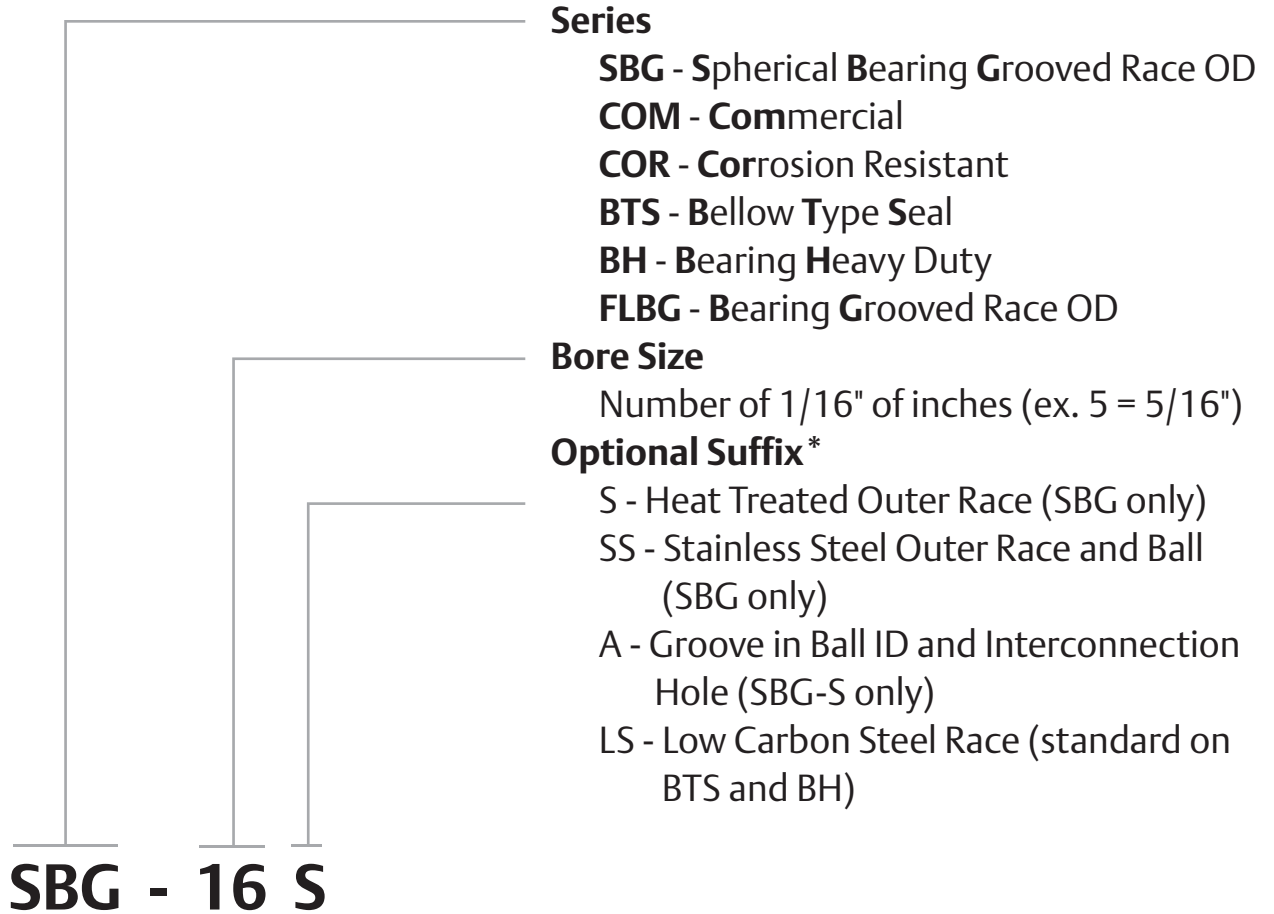

Sealmaster spherical plain bearings perform a similar function as rod end bearings and must be supported in a housing. Sealmaster spherical plain bearings are designed with a variety of outer race materials including steel, heat treated steel, bronze, stainless steel and heat treated stainless steel for flexibility in a wide range of application requirements. In addition Sealmaster spherical plain bearings can accommodate angular misalignment to provide ease in assembly and smooth motion transfer in a variety of applications.

# Spherical Plain Bearing Nomenclature

\* Options listed may not be available on all sizes and configurations, refer to product tables or consult Application Engineering for more information.

# SEALMASTER® Spherical Plain Bearings

## Features and Benefits

### One-piece Race

- Helps reduce pound-out in applications with high frequency oscillation, vibration or shock loading
- Improved spherical ball-race conformity for even load distribution
- Precision ball-race fit
- Outer race lubrication grooves and interconnecting hole in outer race to direct grease to the ball and race area. The outer races are chamfered to facilitate installation and retention into housings
- Steel, heat treated steel, stainless steel, and heat treated stainless steel materials

### Ball

- Alloy steel heat treated and chrome plated for corrosion resistance
- Heat treated stainless steel balls for corrosion resistance

## Multiple Configurations

### Sealmaster SBG Precision Spherical Plain Bearings

- SBG series contain a bronze outer race and alloy steel, heat treated, chrome plated ball for wear resistance properties. This material combination provides for low coefficient of friction.

### Sealmaster SBG-S Precision Spherical Plain Bearings

- SBG-S series utilize an alloy steel, heat treated outer race with protective coating for corrosion resistance and alloy steel, heat treated, chrome plated ball for wear resistance properties

### Sealmaster SBG-SS Precision Spherical Plain Bearings

- SBG-SS series is manufactured with a 300 series stainless steel outer race for corrosion resistance and a stainless steel, heat treated ball for corrosion resistance.

### Sealmaster SBG-SA Precision Spherical Plain Bearings

- SBG-SA series is the same as the SBG-S series and has a groove in ball ID and interconnecting hole to facilitate lubrication from the shaft into the bearing

## Multiple Configurations continued

### Sealmaster COR Precision Spherical Plain Bearings

- COR series spherical plain bearings have a stainless steel, heat treated outer race for strength and corrosion resistance and stainless steel, heat treated ball for corrosion resistance

### Sealmaster FLBG Precision Spherical Plain Bearings

- FLBG series is available in with a carbon steel outer race with protective coating for corrosion resistance and bronze race. Also contains an alloy steel, heat treated, chrome plated ball for wear resistance properties

### Sealmaster COM Commercial Series Spherical Plain Bearings

- Bore sizes from 3/16" to 1"
- Materials include a carbon steel outer race with protective coating for corrosion resistance with an alloy steel, heat treated, chrome plated ball for wear resistance properties
- Outer race lubrication grooves and interconnecting hole in outer race direct grease to the ball and race area. The outer races are chamfered to facilitate installation and retention into housings

### Sealmaster BH-LS Heavy Duty Spherical Plain Bearings

- Heavy duty bearings with radial static load capacities up to 221,000 lbs.
- Available in 1", 1-3/16", 1-1/4", 1-1/2", 1-3/4" and 2" bore sizes
- Materials include a carbon steel outer race with protective coating for corrosion resistance and alloy steel, heat treated, chrome plated ball for wear resistance properties
- Outer race lubrication grooves and interconnecting hole in outer race direct grease to the ball and race area. The outer races are chamfered to facilitate installation and retention into housings.

## Multiple Configurations continued

### Sealmaster BTS-LS Sealed Spherical Plain Bearings

- This is a sealed design for applications where the bearing is exposed to dirt, dust, moisture and contaminants. They are available in four bore sizes (3/4", 1", 1-1/4" and 1-1/2")
- Materials include a carbon steel outer race with protective coating for corrosion resistance and alloy steel, heat treated, chrome plated ball for wear resistance properties
- Integral nitrile rubber "bellows type" seals misalign with the bearing and help reduce contaminant entry as well as seal in lubricant.
- Outer race lubrication grooves and interconnecting hole in outer race direct grease to the ball and race area. The outer races are chamfered to facilitate installation and retention into housings.

## Design Modifications

Sealmaster spherical plain bearings can be ordered with the following design modifications at an extra cost.

Special Modifications	Design Modifications	Option Offered on These Series	Ordering Instructions and Example for Specifying
	Groove on Ball I.D. and Interconnecting Hole	SBG	Add "A" to part number suffix Example: SBG-8A

# Spherical Plain Bearings **SEALMASTER**®

| CFF-TY, CFFL-TY | TRE-Y, TREL-Y   |
| CFM-TY, CFML-TY | TRE-YN, TREL-YN |

- Sealmaster Y-studs are available with the above rod end series to facilitate right angle connections in a variety of linkage applications.
- To order, add the letter Y to the rod end part number; Example: TR-8Y.
- Sealmaster Y-studs are manufactured from carbon steel and plated for corrosion resistance.
- They are secured in the rod end bore, threaded and manufactured with a hex wrench flat.
- Rod ends with Y-studs can accommodate up to  $\pm 25$  degrees of angular misalignment in any direction for linkage design flexibility.
- Y-stud thread sizes are the same as the corresponding rod end and are available in right hand threads only.

Caution: When selecting rod ends with Y-studs: Catalog load ratings are not applicable with Y-studs because of the reduced stud strength due to bending. For load ratings with Y-studs contact Application Engineering.

# Rod Ends and Spherical Plain Bearing Engineering Section

Sealmaster rod ends can be joined together or connected with a threaded rod or tube to form linkage assemblies allowing design engineers flexibility in transferring motion between points with long center distances.

Normal operation of rod ends results in wear of the raceways or fatigue or fracture of the outer member. Give consideration to this in the design of the equipment. Spherical plain bearings provide a similar function as rod ends and must be supported in a housing. Spherical plain bearings afford customers greater load rating per equivalent rod end bore size. This occurs because rod end load capacity is controlled by the head and shank geometry.

Spherical plain bearings have a larger bearing area and generally are less restricted by the housing material or dimensions in which they are mounted.

## Load Ratings

### Rod Ends

Static radial load ratings are applied perpendicular to the bearing ball bore and are a function of strength of race and housing materials. Sealmaster static load ratings listed in this catalog are maximum working loads and factors of safety should be applied as necessary. External conditions including mounting components, bolts, pins and housings should be considered separately when designing this product into an application. Static axial load ratings are applied parallel or through the bearing ball bore. In general, rod ends are not intended to carry axial loads. Applications of rod ends with axial loading should be reviewed with Application Engineering.

### Spherical Bearings

Static radial load ratings listed in the catalog are based on a maximum permanent set in the bearing race of .2% of normal ball diameter.

Static axial load ratings are approximately 20% of the radial static load ratings listed with each unit. Caution should be exercised in designing adequate housings to support spherical bearings.

### Angular Misalignment

Sealmaster rod ends and spherical plain bearings are primarily selected for their ability to withstand misalignment. As an example, a rod end and a shaft may not always be positioned at right angles and misalignment capability is important. Misalignment can occur through wear, tolerance build-up, structural deflection, or in design. The angle of misalignment in a rod end is controlled by the outside diameter of the head and ball width. The maximum degree of misalignment is obtained when the head contacts the inside of the fork or clevis in which it is mounted. Greater than catalog misalignment can be accomplished by adding a spacer washer between the ball flat and the clevis I.D. or by selecting a rod end with a Y-Stud. The angle of misalignment in a spherical bearing is calculated somewhat differently than a rod end. Illustrated on the following page are common mountings for spherical bearings and the corresponding formula for calculating the angle of misalignment.

## Rod Ends and Spherical Plain Bearing Engineering Section

### Common Retention Methods

Clevis mounting is a common practice in securing rod ends in an application. Generally they are assembled into the clevis (or yoke) with a bolt or machined pin.

#### Clevis Installation

#### Shoulder on Shaft with Lock Nut

Rod End Grease Fitting Table			
Bore Size	Fitting Number	Thread Size	Hex size
1/4" - 7/16"	#3018 (no ball check)	#6-40 UNF-2A	1/4"
1/2" - 1"	#3016 (no ball check)	#10-32 UNF-2A	1/4"

### Lubrication

Sealmaster metal three-piece rod ends are greased from the factory and can be furnished with grease fittings on sizes #4 through #16 to facilitate relubrication in the field. Sealmaster CFF/CFM two-piece rod ends are oil coated and are also available with grease fittings. Sealmaster spherical bearings are oil coated except the stainless steel series which are dry. The BH-LS and BTS-LS series are greased from the factory.

Periodic relubrication helps prevent excessive wear, protects balls and races from corrosion, purges contamination and wear debris and helps to seal against contamination. Relubrication is recommended whenever possible for most applications. The length of interval between greasing is dependent on the application parameters and external conditions. Self-Lubricating PTFE and Delrin\* rod ends are generally used where grease relubrication is not practical or desirable. Zerk type threaded grease fittings (designated as "N" suffix) are available on all rod end series except for PTFE and DELRIN. Replacement grease fittings can be ordered by identifying the appropriate rod end series and size.

Caution: Catalog load ratings of rod ends are not applicable when grease fittings are specified, because of the reduced cross section of the head. When selecting rod ends with grease fittings, consult Application Engineering for static load capacities.

# Rod Ends and Spherical Plain Bearing Engineering Section

Sealmaster spherical plain bearings are manufactured with two lubrication systems which provide a path for lubrication to the ball and race area.

Outer races are manufactured with lubrication grooves and an interconnecting hole in the outer race to direct grease to the ball and race area. Standard on the following series: COM, SBG, SBG-S, SBG-SS, COR, FLBG, HH-LS, BTS-LS

A groove on the ball I.D. and interconnecting hole on "A" series only, directs lubrication from the shaft to the ball and race area. Standard on the SBG-SA

## Application

Sealmaster rod ends and spherical plain bearings are designed to provide an efficient smooth transfer of motion in a wide variety of applications and equipment. This motion is usually associated with various types of linkage controls. Commonly referred to as plain or sliding bearings, they are designed primarily to assist and provide motion transfer, support a load, allow for angular motion and angular misalignment. Sealmaster rod ends and spherical bearings serve the industrial market. Typical applications for rod ends and spherical plain bearings can be found in:

- Textile Equipment
- Food Processing
- Bakery Equipment
- Recreational Equipment
- Farm/Garden Machinery
- Bottling Equipment
- Printing Machinery
- Material Handling
- Mining Machinery
- Packaging Machinery
- Labeling Machinery
- Industrial Fans
- Construction Equipment
- Exercise Machines
- Dairy Machinery
- Agricultural Equipment
- Transportation Equipment
- Off-Road Equipment

CRES

CORROSION RESISTANT ENGINEERED SOLUTIONS

# ***CRES Bearings***

Corrosion Resistant Engineered Solutions (CRES) bearings address various industries and applications by providing multiple solutions utilizing a variety of materials and sealing elements. CRES bearings assist customers in meeting HACCP (Hazardous Analysis and Critical Control Point) procedures and stringent plant cleaning requirements including both CIP (Clean in Place) and SIP (Steam in Place).

## McGill CRES Cam Follower Bearings

McGill CAMROL® bearings are full complement needle bearings featuring 400 series corrosion resistant steel material and are available in two basic mounting styles for use mechanical automation or linear motion applications. Our basic features each contribute to superior performance, while the LUBRI-DISC® and LUBRI-DISC +® seal feature helps prevent metal to metal contact within the bearing while providing a barrier for contaminant entry while still providing blowout protection when relubricating. In addition to the seal feature these bearings are available with several dimensional choices and combinations to provide a specific solution for the application. Within the following section you can learn more about these features and how they can be applied to your application.

\*LUBRI-DISC+ seal is used on bearings with a 1" O.D. and larger. Smaller sizes use LUBRI-DISC seals.

## Cam Follower CRES Nomenclature

\* LUBRI-DISC+ seal is used on bearings with a 1" O.D. and larger. Smaller sizes use LUBRI-DISC seals.

## Features and Benefits

### 400 Series Corrosion Resistant Steel

Manufactured from bearing quality 400 series corrosion resistant steel components for improved resistance to both external and internal corrosion. CRES CAMROL bearings are dimensionally interchangeable with standard CAMROL® bearings and easily identifiable with "CR" designation

### Single Row Full Complement Needle Rollers

The small roller diameter to length ratio of needle rollers provides the maximum amount of rollers, with minimal radial section, which helps support radial loads with minimal deflection. The CRES series also incorporate 400 series corrosion resistant steel needles providing a balance between corrosion resistance and bearing capacity.

### Heavy Section Outer

The heavy section outer helps support radial loading and provide proper rolling element support.

### LUBRI-DISC+ SEAL

The LUBRI-DISC®+ seal is provided in sizes 1" and larger and offers a lip wiping seal for improved protection against liquid contamination while maintaining all the benefits of a standard Lubri-Disc® seal. The enhanced seal helps provide up to five times better protection against water entry due to wash down. The CAMROL standard for seals, the Lubri-Disc seal not only helps keep contaminants out and lubrication in the bearing, but with an integral back plate to separate the metal to metal contact between the outer ring and endplate(s) or flange. The back plate feature reduce friction resulting in lower operating temperatures which can extend grease life and allowing for higher operating speeds. Our seal also includes vents to help prevent seal blowout during relubrication, while the outer raceway is machined with a reservoir for additional lubricant capacity. The Lubri-Disc+ seal balances sealing, lubricant capacity, and low drag operation essential to a precision cam follower suited for most industrial applications requiring a corrosion resistant solution.

### Cylindrical Outside Diameter (OD)

The cylindrical OD can improve performance in certain applications such as improved track capacity by maximizing the contact area with the track.

## Features and Benefits continued

### Zone Hardened Raceways

Inner studs are induction heat treated in the roller path and flange surfaces only. The remainder of the stud has a mild hardness (generally below 46HRC) resulting in a ductile stem that provides toughness.

### Integral Flange

The integral flange helps maintain bearing integrity throughout the bearing life. Zone hardened to provide wear resistance from incidental contact with the outer or rollers, and provides a sealing surface for the LUBRI-DISC<sup>®</sup> or LUBRI-DISC+<sup>®</sup> seal.

### Hardened Endplate

Similar to the flange, the endplate must provide a seal surface for the seal and resist wear from incidental contact with the outer or rollers. The hardened and ground endplate provides a sealing surface for the LUBRI-DISC<sup>®</sup> or LUBRI-DISC+<sup>®</sup> seal.

### Factory Grease Fill

The cam follower and cam yoke roller bearings are factory lubricated with H1 food grade grease. Contact Application Engineering when application conditions require special lubricants.

## Features and Benefits continued

### Lubrication Holes

Depending on size, McGill CAMROL bearings may include lubrication holes to accept a standard drive fitting or included oil hole plug(s). The oil hole plug is recommended for closing unused hole to help protect against bearing contamination or lubrication loss.

### Permanent Marking

Part number permanently marked on bearing face, helps bearing identification after years of service.

### Hole Plug (s)

All McGill Cam followers include 1-2 (depending on # of holes) lubrication hole plugs to help provide proper lubrication path to the rolling elements and prevent contamination from entering the bearing through an unused hole.

## Options

### Eccentric Stud

Eccentric stud option provides a means of adjusting the radial position of the bearing which can improve the load sharing of inline bearing combinations. Cam follower load sharing helps reduce operation costs by reducing premature failures due to overloaded bearings, the need of precise mounting hole location tolerances and providing ability to realign bearing due to track wear.

## **Custom Capabilities**

- *Customer Specified factory grease fill*
- *Grease Fitting Installed*
- *Stud or thread length modifications*
- *Roller diameter variations or tolerances*
- *Cam followers grouped or matched diameter tolerance / run out sets*
- *Custom engineered to order designs*

Note:  
 1. Clamping torque is based on lubricated threads. If threads are dry, double the value listed.  
 2. Since load, lubrication method, temperature and other factors affect the maximum operating speed, it is impossible to determine precise limiting speeds. The listed limiting speeds are based on lightly loaded bearings having adequate lubrication and are listed only as a design guide. More frequent relubrication is required when operating at higher speeds. Actual bearing testing in the specific application should be conducted if the operating speed approaches the listed limiting speed.  
 3. Use track roller dynamic load rating for life calculations. Maximum dynamic load should not exceed 50% of track roller dynamic load rating. If radial load and/or root mean load exceed 50% of track roller dynamic load rating, life calculations must be reviewed by Application Engineering. If dynamic loads exceed 25% of basic dynamic rating, consideration should be given to use of CYR CRES series CAMROL bearing. For more information please contact Application Engineering (800) 626-2093.  
 4. The track roller static load rating is based on stud strength. Exceeding the static load rating may impair subsequent dynamic operation.

# McGILL® CRES CAMROL Bearings

CRES Bearings

- Basic Construction Type:** Stud Type 400 Series Stainless Steel
- Rolling Elements:** Full Complement Needle 400 Series Corrosion Resistant Steel
- Seal Type:** LUBRI-DISC (7/8" & smaller)  
LUBRI-DISC+ (1" & larger)
- Lubrication:** H1 Food Grade Grease
- System Configuration:** Concentric / Eccentric Stud
- Mounting Feature:** Hex Hole
- Dimensional Interchange:** Standard Camrol

 1. Clamping torque is based on lubricated threads. If threads are dry, double the value listed.  
 2. Since load, lubrication method, temperature and other factors affect the maximum operating speed, it is impossible to determine precise limiting speeds. The listed limiting speeds are based on lightly loaded bearings having adequate lubrication and are listed only as a design guide. More frequent relubrication is required when operating at higher speeds. Actual bearing testing in the specific application should be conducted if the operating speed approaches the listed limiting speed.

CYR-CR Series

Not all parts are available from stock. Please contact customer service for availability (800) 626-2120.

For more information on bearing capabilities outside of our standard offering, please contact Application Engineering (800) 626-2093.

## Sealmaster RPB-CR Series Mounted Tapered Roller Bearings

Sealmaster RPB-CR self aligning high capacity tapered roller bearings include a fluoropolymer coated housing and lock collars, stainless steel grease fittings, single lip contact seal and GoldPlex-FG (USDA H1) food grade grease for corrosion resistant applications. The fluoropolymer coating is resistant to most chemicals and hydrocarbon solvents. These bearings are used in applications where they may be subjected to moisture, corrosive and abrasive environments. Depending on your preference, these bearings are available in two or four bolt pillow blocks and four bolt flanges as illustrated on the pages to follow.

# RPB-CR Bearing Nomenclature

## Features and Benefits

### Tapered Roller Bearings

Sealmaster® RPB-CR series contains heavy duty tapered roller bearings for radial, thrust and combination loading

### Fluoropolymer Coated Cast Iron Split Housings

This non-stick coating on the housing and cap bolts, offers resistance to chemicals and performs better than painted or nickel coated housings in our testing. Stainless steel cap bolt washers and grease fittings also provide resistance to corrosion. Permanent metal nameplate allows for easy identification (For more information on fluoropolymer coating see page K-76).

### Replaceable Cartridge Insert (RCI)

The heart of the RPB-CR is the unitized, self-aligning cartridge insert with integral seals and double locking collars. The replaceable cartridge insert can accommodate +/- 3° static misalignment capability has factory controlled clearances and is factory sealed and lubricated. The cartridges fit all housing styles and are field replaceable for quick change out. RCI outer races are black oxide treated.

### Contact Seals

Single lip race mounted contact seal is composed of a steel inner seal with a bonded elastomeric sealing member. The steel inner seal is press fitted into the inside diameter of the outer race, while the bonded elastomeric sealing member is held in the proper rubbing contact position on the outer diameter of the inner race. Black oxidized seal stampings inhibits corrosion.

## Features and Benefits continued

### Positive Lubrication System

Positive lubrication system provides direct grease path to the bearing. The unit is designed with two lubrication ports in the cartridge OD so that one of the lube holes in the cartridge lines up with grease fitting regardless of insert orientation in the housing. A rubber grommet in housing top recess directs lubricant into bearing cavity. Extra lubrication ports help prevent seal damage by venting excess pressure from over greasing. Sealmaster alignment pin helps prevent outer race rotation.

### Collar Mount System

Two fluoropolymer coated locking collars are standard on all units with two setscrews at 120° for balanced three point contact. Precision manufactured diamond faceted setscrew design contributes to improved clamping and resistance to back out. Single locking collars are available where space limitations are present.

### Specialized Food Grade Lubrication

The Sealmaster RPB-CR bearings are factory filled with Sealmaster GoldPlex-FG (Food Grade) grease (USDA H1 approved) which is suitable for mounted bearing lubrication where incidental contact with food products may occur in any application where clean, routine lubrication is required. For more information on Sealmaster GoldPlex-FG see page L-6.

## Sealmaster PN Gold Mounted Ball Bearings

Sealmaster PN Gold mounted bearings feature high phosphorus, electroless nickel coated steel insert with patented seal technology available in either setscrew or SKWEZLOC™ concentric locking collar, within a variety of 316 stainless casting high strength composite fluoropolymer coated cast iron housing configurations. The high performance triple lip seal is the latest innovation of over 10 patents on sealing technology. The combination of stainless flingers and FKM lip materials provide a strong contaminant resistance and GoldPlex FG (USDA H1) food grade grease loss. Specially engineered for industries with corrosive wash down environments such as food and beverage, pharmaceuticals and chemical processing. PN Gold mounted ball bearings provide outstanding performance in demanding corrosive environments.

# Sealmaster PN Gold Nomenclature

**Corrosion Resistant**

**Options**

- B - Machined For Bolt On End Cap And Backside Shield Included SF, SFT And FB Only
- M - Medium Duty (where available)

**Housing Type\*** (see below)

**Housing Material**

- S - Stainless Steel
- C - Composite
- F - Fluoropolymer Coated Cast Iron<sup>†</sup>

**Phosphorous Nickel**

**Bore Size**

- Inch - ##/16" (ex. 20/16 = 1 1/4")
- R for 1 1/4" and 2" Reduced Only
- Metric - Standard Duty - 2##, ## x 5 mm (ex. 05 = 25 mm)

**Standard Option**

- T - SKWEZLOC Locking Collar
- RMW - Reduced Maintenance Washdown, plugged no lube fitting
- S - Obsolete Plugged "Sealed for Life" Option Replaced by RMW where available

**CR B FS - PN16 T RMW**

**Housing Type\***

- P - Pillow Block
- FT - 2 Bolt Flange
- F - 4 Bolt Flange
- FB - Flange Bracket
- TB - Tapped Base
- PL - Low Base Pillow Block
- FC - Flange Cartridge
- ST - Wide Slot Take Up
- EHB - Hanger Bearing

\* All housing styles are not available in all materials.  
 \*\* Metric bore units are "soft metric" - lube fitting and setscrews or Skwezloc Locking Collar threads are inch threads, bolt holes on flanges are inch drill size and tapped base threads are inch.  
<sup>†</sup> For more information on fluoropolymer see page K-76.

## Features and Benefits

### Bearing Races

The inner and outer ring of the Sealmaster PN Gold are a high phosphorous electroless nickel plated 52100 steel for exceptional corrosion resistance.

### Wide Outer Race

Sealmaster has the industry's widest outer race. The high phosphorous, electroless nickel outer race is 20 to 30% wider than industry standard outer races. This feature results in increased grease capacity, improved sealing options and increases the surface area for absorption of shock load.

The outer race has a Tapered Land profile. The outer land surface in a conventional bearing is parallel to the axis of the inner ring. The Tapered Lands surface is tapered in a radial direction toward the bearing race. This subtle yet crucial design change ensures that lubricant will be easily redirected back to the raceway. With improved bearing lubricant circulation comes significantly longer bearing service life. This improved circulation and service life comes without any reductions in bearing radial or thrust capacities.

Note: The illustration to the left is an exaggerated figure to demonstrate the difference between standard vs. Tapered Lands.

For bearings that are maintained and relubricated on a regular basis, there is no significant difference in expected service life.

### Multiple Locking Methods

#### Setscrew Locking

300 series stainless steel 120° spaced, balanced three point contact minimizes inner ring distortion vibration, reduces noise, and improves reliability.

#### Skwezloc® Concentric Locking Collar

SKWEZLOC is a concentric collar clamp design that results in near-perfect concentricity of the shaft to bearing bore and maintains near perfect ball path roundness, while reducing fretting corrosion. This design eliminates the shaft damage of setscrew locking, and minimizes bearing induced vibration for smoother quieter operation. The collar is fluoropolymer coated with an Endurion\* coated TORX head cap screw that outlasts stripping 12 times longer than hex head cap screws.

# Features and Benefits continued

## High Performance Seal (HPS)

The triple lip contact seal design provides multi-directional sealing to minimize contamination ingress and retain lubrication – standard on all units. The 304 stainless steel shell and flingers protect from incoming contaminants and provide wear resistant contact surface to all three seal lips. The grease cavities in seal assembly are factory-filled with H1 Food Grade lubricant prior to shipment for additional contaminant resistance.

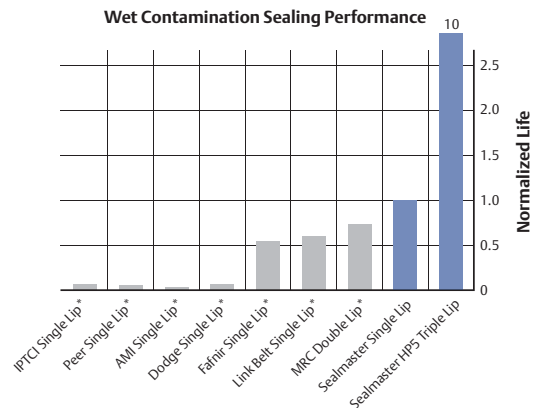

The illustrations below show the relative performance of seals in a wet contamination test as well as the test itself. Complete bearings with seals are sprayed with a 5% salt solution at 100°F. The bearings operate continuously at 500 RPM for 3 hours and idle for 1 hour. The cyclical condition test is complete after 480 hours.

The graphic below illustrates the relative performance of rubber contact seals in a slurry contamination test. The bearing is submerged halfway into a sand, salt and water mixture (as shown in illustration). The bearing rotates while a separate motor stirs the mixture. The test is stopped when the slurry mixture leaks past the seal.

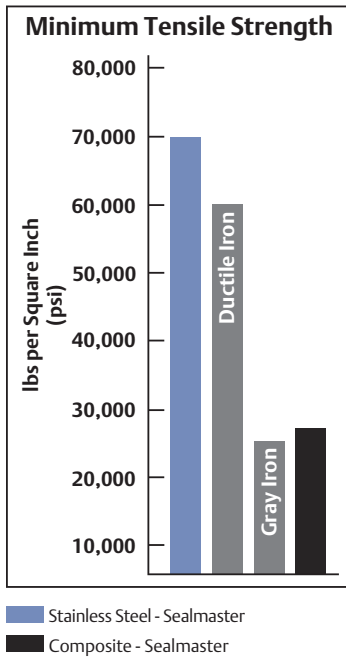

Simulation of Slurry Contamination Test

## Features and Benefits continued

### Stainless Steel Housing

High quality solid base designed investment cast passivated 316 stainless steel casting providing the highest amount corrosion resistance currently available for stainless steel housings. The investment cast process yields a smooth, easy to clean surface. The solid construction with machined base was designed for minimal gaps with no fillings.

### Composite Housing

High strength composite with reinforced stainless steel bolt ferrules for high load capacity and increased strength around the bolt holes. The solid construction with machined base was designed for minimal gaps with no fillings.

\*Note: Trade names and trademarks can be found on page K-32

## Features and Benefits continued

### Specialized Food Grade Lubrication

The Sealmaster PN Gold bearings are factory filled with Sealmaster GoldPlex-FG (Food Grade) grease (USDA H1 approved) which is suitable for mounted bearing lubrication where incidental contact with food products may occur in any application where clean, routine lubrication is required. For more information on Sealmaster GoldPlex-FG see page L-6.

### Lock Pin and Dimple

The Sealmaster exclusive locking pin and dimple system provides a direct lubricant into the bearing cavity & ball path instead of around a lubrication groove, prevents outer ring rotation (sometimes referred to as “creep”), and allows  $\pm 2^\circ$  static misalignment of the bearing insert

### Zone Hardening Inner Race

Sealmaster incorporates a unique heat treat process that hardens the inner race only where it is needed...under the ball path. The high phosphorous electroless nickel plated 52100 steel, zone hardened inner race results improved lock reliability as a result of less distortion at setscrew location and improved thread conformity resulting in improved clamping and resistance to setscrew back-out.

### Land Riding Retainer

The Sealmaster unique land riding metal retainer design provides superior pocket clearance that allows for 360° grease circulation around the rolling elements resulting in better retained and utilized lubrication. The land riding design of the retainer minimizes wear on both Ball and retainer, while maximizing stability, which is especially important in applications involving vibration, shock loading or high operating speeds.

### Accessories

Optional accessories are available and can be found in the Accessories section starting on page L-1.

# Sealmaster ERX-TREME PN Gold Style Ball Bearings

Sealmaster ERX-TREME PN Gold bearings feature high phosphorus, electroless nickel coated steel with patented seal technology and tapered land outer race profile available in either setscrew or SKWEZLOC™ concentric locking collar, with a cylindrical OD and snap ring for easy installation in a housing. The high performance triple lip seal is the latest innovation of over 10 patents on sealing technology. The combination of stainless flingers and FKM lip materials provide a strong contaminant resistance and, GoldPlex-FG (USDA H1) food grade grease loss. Specially engineered for industries with corrosive wash down environments such as food and beverage, pharmaceuticals and chemical processing, the ERX-TREME PN Gold mounted ball bearings provide outstanding performance in demanding corrosive environments.

# Sealmaster ERX-TREME PN Nomenclature

\*Metric bore units are "soft metric" - setscrew and Skwezloc Locking Collar threads are inch threads.

## Features and Benefits

### Bearing Races

The inner and outer ring of the Sealmaster ERX-Treme PN Gold bearing are high phosphorous, electroless nickel plated 52100 steel for exceptional corrosion resistance and the outer race profile features the Tapered Lands geometry.

The outer land surface in a conventional bearing is parallel to the axis of the inner ring. The Tapered Lands surface is tapered in a radial direction toward the bearing race. This subtle yet crucial design change ensures that lubricant will be easily redirected back to the raceway. With improved bearing lubricant circulation comes significantly longer bearing service life. This improved circulation and service life comes without any reductions in bearing radial or thrust capacities.

\* For bearings that are maintained and relubricated on a regular basis, there is no significant difference in expected service life.

### High Performance Seal (HPS)

The triple lip contact seal design provides multi-directional sealing to minimize contamination ingress and retain lubrication – standard on all units. The 304 stainless steel shell and flingers protect from incoming contaminants and provide wear resistant contact surface to all three seal lips. The grease cavities in seal assembly are factory-filled with lubricant prior to shipment for additional contaminant resistance.

For more information on seal performance see page K-32.

## Features and Benefits continued

### Multiple Locking Methods

#### Setscrew Locking

300 series stainless steel 120° spaced, balanced three point contact minimizes inner ring distortion vibration, reduces noise, and improves reliability.

#### Skwezloc<sup>®</sup> Concentric Locking Collar

SKWEZLOC is a concentric collar clamp design that results in near-perfect concentricity of the shaft to bearing bore and maintains near perfect ball path roundness, while reducing fretting corrosion. This design eliminates the shaft damage of setscrew locking, and minimizes bearing induced vibration for smoother quieter operation. The collar is fluoropolymer coated with an Endurion\* coated TORX head cap screw that outlasts stripping 12 times longer than hex head cap screws.

#### Specialized Food Grade Lubrication

The Sealmaster PN Gold bearings are factory filled with Sealmaster GoldPlex-FG (Food Grade) grease (USDA H1 approved) which is suitable for mounted bearing lubrication where incidental contact with food products may occur in any application where clean, routine lubrication is required. For more information on Sealmaster GoldPlex-FG see page L-6.

#### Zone Hardening Inner Race

Sealmaster incorporates a unique heat treat process that hardens the inner race only where it is needed...under the ball path. The high phosphorous electroless nickel plated 52100 steel, zone hardened inner race results improved lock reliability as a result of less distortion at setscrew location and improved thread conformity resulting in improved clamping and resistance to setscrew back-out.

#### Land Riding Retainer

The Sealmaster unique land riding metal retainer design provides superior pocket clearance that allows for 360° grease circulation around the rolling elements resulting in better retained and utilized lubrication. The land riding design of the retainer minimizes wear on both Ball and retainer, while maximizing stability, which is especially important in applications involving vibration, shock loading or high operating speeds.

## Sealmaster CR Gold Mounted Ball Bearings

Sealmaster CR Gold mounted bearings feature a black oxide treated setscrew locking single row ball bearing utilizing 316 passivated stainless steel housing. The bearing features a Sealmaster nitrile rubber single lip contact seal with stainless steel flinger to help prevent contaminants from entering and help contain the factory fill of Sealmaster Goldplex-FG™ food grade grease. Depending on your preference, these bearings are available in pillow block, two bolt flange, four bolt flange, and three bolt flange bracket configurations as illustrated on the pages to follow.

## Sealmaster CR Gold Nomenclature

## Features and Benefits

### Stainless Steel Housing

High quality solid base designed investment cast passivated 316 stainless steel casting providing the highest amount corrosion resistance currently available for stainless steel housings. The investment cast process yields a smooth, easy to clean surface. The solid construction with machined base was designed for minimal gaps with no fillings.

### Wide Outer Race

Sealmaster has the industry's widest outer race. The black oxidized outer race is 20 to 30% wider than industry standard outer races. This feature provides increased grease capacity, improved sealing options, and more insert stability.

### Lock Pin and Dimple

The Sealmaster exclusive locking pin and dimple system provides direct lubricant into the bearing cavity & ball path instead of around a lubrication groove, prevents outer ring rotation (sometimes referred to as "creep"), and allows  $\pm 2^\circ$  static misalignment of the bearing insert

### Single Lip Contact Seal

Single Lip Contact Seal consists of a nitrile rubber washer in metal shroud to shield the lip from large contaminants. The seal is designed to balance drag and protection in wet and dry environments.

## Features and Benefits continued

### Setscrew Locking

120° spaced, balanced three point contact minimizes inner ring distortion vibration, reduces noise, and improves reliability. Precision manufactured diamond faceted setscrews contribute to improved clamping and resistance to back out.

### Zone Hardening Inner Race

Sealmaster incorporates a unique heat treat process that hardens the inner race only where it is needed...under the ball path. The black oxidized zone hardened inner race results improved lock reliability as a result of less distortion at setscrew location and improved thread conformity resulting in improved clamping and resistance to setscrew back-out

### Land Riding Retainer

The Sealmaster unique land riding metal retainer design provides superior pocket clearance allows for 360° oil circulation around the rolling elements resulting in better retained and utilized lubrication.

### Specialized Food Grade Lubrication

The Sealmaster PN Gold bearings are factory filled with Sealmaster GoldPlex-FG (Food Grade) grease (USDA H1 approved) which is suitable for mounted bearing lubrication where incidental contact with food products may occur in any application where clean, routine lubrication is required. For more information on Sealmaster GoldPlex-FG see page L-6.

### Product Identification

Specialized laser identification for permanent brand and nomenclature identification.

# SEALMASTER® CR Gold Mounted Ball Bearings

CR Series Bearings

- Duty:** Standard
- Rolling Elements:** 52100 Steel Balls
- Housing:** 316 Passivated Stainless Steel Pillow Block
- Self-Alignment:** +/- 2 Degrees
- Lock:** Setscrew
- Seal:** Single Lip Rubber Contact Seal
- Temperature:** -20° to 220° F
- Grease:** Sealmaster GoldPlex-HP

# Fluoropolymer Coating

## Used On:

- RPB-CR Units
- PN Gold Units with Fluoropolymer Cast Iron. As listed on pages K-53 to K-57.

The chart below demonstrates the effectiveness of this corrosion-resistant polymer coating for a variety of atmospheric conditions and other physical qualities, against other popular materials. It is also important to note that **SEALMASTER RPB-CR Duty Bearings** have the housing bores coated

## Load Ratings for Sealmaster PN Gold & CR Gold

This chart displays load capacity in pounds for a given L10 life, speed and shaft size. The shaded areas indicate the maximum speed ratings for CR Gold only. The values in the table represent loads at ideal conditions with press fit mounting to the shaft. ABMA recommends applying life adjustments factors for slip fit mounted ball bearings and when using alternative race materials. To obtain de-rated load, divide load in the table by 1.29. The values in the table represent equivalent radial loads only. For combined radial and thrust load, the equivalent radial load must be calculated before applying the load in the table. Refer to Mounted Ball Engineering Section G for more information on calculating L10.

- Notes:
- Not all shaft sizes are available for each product line; refer to the product pages to determine availability.
  - Typical operating temperature range of CR Gold and PN Gold bearings are -20° F to 220° F (0° F to 150° F for composite housings).
  - For loads, speeds and temperature not listed, contact Application Engineering at 800-626-2093.

# Load Ratings for Sealmaster RPB-CR

This chart displays load capacity in pounds for a given L10 life, speed and shaft size. The values in the table represent equivalent radial loads only. For combined radial and thrust load, the equivalent radial load must be calculated before applying the load in the table. Refer to Mounted Roller Engineering Section I for more information on calculating L10, and page I-56 for Single Row Basic Dynamic Rating.

- Notes:
- Typical operating temperature ranges for standard bearings are -20° F to 220° F.
  - For loads, speeds outside the rating chart, contact Application Engineering at 800-626-2093.

# Installation Instructions

- **Sealmaster RPB-CR**

Refer to page I-59

- **Sealmaster PN Gold and CR Gold**

Refer to page K-80

## PN Gold and CR Gold Bearing Installation

### Mounting Housed Bearing Units:

#### NOTICE

- These bearings are designed for maximum permissible static misalignment of  $\pm 2$  degrees. Installation, handling or operation of the bearing in excess of the maximum of  $\pm 2$  degrees can cause reduction in bearing performance and may lead to equipment failure.
- Do not strike or hammer on any component of the bearing and/or shaft. Impact can result in damage to the bearing that may cause reduction in bearing performance and may lead to equipment failure.

#### Step 1: Inspect Shaft and Bore

Shaft should be within tolerance range shown in Table 1, clean and free of nicks and burrs. Mount bearings on unused section of shafting or repair/replace shafting as required. Inspect both the shaft and bearing bore for debris or contaminants. Wipe clean as necessary.

PN/CR Gold Table 1

Recommended Shaft Tolerances	
Nominal Bore Diameter	Tolerance (Inches)
1/2 - 1 15/16	+0.0000 / -0.0005
2 - 3 3/16	+0.0000 / -0.0010
3 1/4 - 4 15/16	+0.0000 / -0.0015

#### Step 2: Check Support Surfaces

Make sure the base of the housing and the support surfaces are clean and free from burrs. If the housing elevation is adjusted with shims these must cover the entire contact area between the housing and the support surface.

#### Step 3: Install Back-side Shield

If a back-side shield is used (2, 3 and 4 bolt flange units), install the shield on the shaft. Verify that the drain slot is facing downward as shown.

#### Step 4: Install Unit

To aid installation, keep weight off bearing during mounting. Slide unit onto shaft by pushing on the inner ring. If it is difficult to mount bearing on shaft, use a piece of emery cloth to reduce any high spots on the shaft.

#### Step 5: Fasten Unit in Place

Install housing mounting bolts and check bearing alignment. Align the bearing units as closely as possible.

Tighten mounting bolts to recommended fastener torques. Check the shaft for freedom of rotation by rotating shaft with hand in both directions.

### PN Gold and CR Gold Bearing Installation continued

#### Step 6: Tighten Locking Mechanism

##### a. Setscrew Locking Inserts

Setscrews in multiple bearing applications should be aligned as shown.

Tighten bearing units to the shaft as follows:

- i. Torque the first setscrew "A" to one half of the recommended torque in Table 2.
- ii. Torque the second setscrew "B" to the full recommended torque. Go back to the first setscrew "A" and tighten to the full recommended torque.

Check shaft again for freedom of rotation and then tighten the second bearing unit in the same fashion. When all bearings are tightened, perform a final check to the shaft for freedom of rotation.

**PN/CR Gold Table 2**

Setscrew Torque			
Screw Size	Hex Size	Inch-Pounds	
		CR-Gold	PN-Gold
1/4-28	1/8	65 - 85	35 - 45
5/16-24	5/32	125 - 165	75 - 100
3/8-24	3/16	230 - 300	125 - 145
7/16-20	7/32	350 - 450	130 - 160
1/2-20	1/4	500 - 650	N/A
5/8-18	5/16	1100 - 1440	N/A

##### b. Skwezloc Locking Inserts

- i. Be sure that the Skwezloc collar is fitted square and snug against the shoulder on the inner ring

- ii. Torque the Skwezloc collar cap screw to the full recommended torque in Table 3.

**PN/CR Gold Table 3**

Skwezloc Concentric Locking Collar Cap Screw Torque		
Screw Size	Hex Size	Inch-Pounds
# 8-32	T-25	70
# 10-24	T-27	100
1/4-20	T-30	240
5/16-18	T-45	495

Check shaft again for freedom of rotation and then tighten the second bearing unit in the same fashion. When all bearings are tightened, perform a final check to the shaft for freedom of rotation.

**Optional End Cap Installation Instructions:**

**Polymer End Caps:**

**Step 1: Position End Cap**

Verify that the drain hole is facing down when the cap is installed as shown. Position the end cap flush against the face of the housing.

**Step 2: Install End Cap**

Press the cap until it snaps into the groove in the housing. Rotate the shaft by hand to verify there is no contact between the shaft and the end cap. If an open end cap is used, there should be no contact between the shaft and the bore of the end cap as shown.

**Stainless Steel End Caps:**

**Step 1: Position End Cap**

Apply silicone sealant evenly onto the housing face where the end cap will contact (optional). Verify that the end cap drain hole is facing down when the cap is installed (for caps with two drain holes, one should be facing down). Position the end cap flush against the face of the housing.

**Step 2: Install End Cap**

Tighten the cap screws to affix the end cap to the housing face. Rotate the shaft by hand to verify there is no contact between the shaft and the end cap. If an open end cap is used, there should be no contact between the shaft and the bore of the end cap.

**Step 3: Install V-Seal (Open End Caps Only)**

Place the V-seal over the shaft. Push the seal up against the outside face of the open end cap, such that the seal lip contacts the outside face of the open end cap as shown. The assembled width of the seal should be approximately 1/4 inch.

### Mounting PN Gold Cylindrical O.D. (ER Style) Inserts

#### Replacing Existing Sealmaster Inserts:

**Note:**

Replacement Sealmaster bearing inserts are intended for use in Sealmaster housings only.

#### Step 1: Loosen and Remove Housing Mounting Bolts

#### Step 2: Remove Bearing from Shaft

Loosen the locking mechanism and slide the bearing off the shaft.

#### Step 3: Remove the Bearing Insert from the Housing

Secure housing in a vise. Remove lubrication fitting and lock pin from the housing. Do not discard the lubrication fitting or lock pin. Using a bar placed in the insert bore as a lever, swing the insert to line up the outer ring with the load slots and remove insert from load slots.

#### Step 4: Inspect and Prepare Housing

Housings should be inspected for damage prior to installation. Wipe housing bore clean as necessary and check that the lubrication hole is clean and free of debris. Wetting of the housing bore with oil or grease may be done to ease installation of bearing insert.

#### Step 5: Load New Insert

With the bearing housing still in the vise, load the insert in the following fashion:

- a. Place the bearing insert into the housing load slots, positioning the insert outer ring dimple and lubrication hole in line with the housing lubrication hole.
  
- b. Using a bar placed in the insert bore as a lever, swing the insert into place within the housing. Insert should have a snug fit in the housing. If insert can be made to swivel by hand in the housing bore, fit is too loose and entire unit should be replaced. If heavy force is required, fit is too tight and entire unit should be replaced.
  
- c. Ensure alignment of the outer ring dimple and lubrication hole and housing lubrication hole.

#### Step 6: Install Lock Pin and Lubrication Fitting

Place the lock pin in the housing lubrication hole, ensuring that it seats in the outer ring dimple. Tighten the lubrication fitting into the housing lubrication hole until snug, then loosen 1/4 turn.

**NOTICE:** Over tightening or under tightening of the lubrication fitting may lead to reduction in bearing performance.

#### Step 7: Refer to Steps 1 - 6 from the "Mounting Housed Bearing Units" Section and the "Optional End Cap Installation Instructions" if applicable

#### Mounted PN Gold Cylindrical O.D. (ER Style) Inserts See page G-248

**Lubrication:**

All Sealmaster PN Gold and CR Gold Ball Bearings are delivered with a high quality food grade grease with an EP additive. The bearing is ready for use with no initial lubrication required. The grease consists of a calcium sulfonate thickener, mineral oil, and NLGI grade 2 consistency.

Compatibility of grease is critical; therefore consult with Application Engineering and your grease supplier to insure greases are compatible. For best performance it is recommended to relubricate with calcium sulfonate thickened grease with a comparable NLGI consistency and base oil properties.

Relubricatable Sealmaster bearings are supplied with grease fittings or zerks for ease of lubrication with hand or automatic grease guns. Always wipe the fitting and grease nozzle clean.

**CAUTION:** If possible, it is recommended to lubricate the bearing while rotating, until grease purge is seen from the seals. If this is not an option due to safety reasons, follow the alternate lubrication procedure below.

**Alternate Lubrication Procedure:**

Stop rotating equipment. Add one half of the recommended amount shown in Table 4. Start the bearing and run for a few minutes. Stop the bearing and add the second half of the recommended amount. A temperature rise after lubrication, sometimes 30°F (17°C), is normal. Bearing should operate at temperatures less than 200°F (94°C) and should not exceed 250° (121°C) for intermittent operation. For lubrication guidelines, see Tables 4 and 5.

**Note:** Table 5 is a general recommendation. Experience and testing may be required for specific applications.

**Note:** Grease charges in Table 4 are based on the use of calcium sulfonate thickened grease with a NLGI grade 2 consistency.

**Speed Limits:**

**Note:** The Maximum Operational Speeds listed in Table 6 are based on the use of a single lock setscrew insert, with single lip contact seals (1C) for CR Gold, and with HPS seals for PN Gold.

**PN/CR Gold Table 4**

Grease Charge for Relubrication			
Series	Bore Size		Grease Charge (Mass - Ounces)
	Standard Duty	Medium Duty	
2-012	1/2 - 3/4	---	.03

# *Accessories*

The bearing products in this catalog may require accessories to further enhance their value. These accessories range from end caps to lubrication. These accessories can be used on several bearing platforms and are available for customization with support from our Application Engineering group.

# End Caps and Backside Seals

Additional sealing accessories are available for enhanced bearing and personal protection. End caps provide a guard from rotating shafts and conform to OSHA requirements for personal protection. In addition, these accessories together can better protect against high-pressure wash down and help reduce bearing moisture contact. Backside shield gaskets are mounted between the bearing and the equipment frame to reduce moisture runoff. Depending on your preference, these accessories are illustrated on the following pages.

## End Caps

End caps offer better protection against high-pressure wash down and can be used to reduce bearing moisture contact and provide personal protection to conform with OSHA and other regulatory guidelines.

### Polymer Snap On Cap

Polypropylene material for resistant to corrosion, hand snap into housing for easy installation, and incorporate a shielded drain hole to reduce moisture buildup against the bearing.

### Stainless Bolt On End Cap

Durable 304 stainless steel for resistance to corrosion and chemical attack, bolts onto housing with four cap screws for excellent holding power, drain hole to be positioned towards the bottom to reduce moisture buildup against the bearing.

## Cap Availability

Product Line	Polymer Snap On	Stainless Bolt On
Sealmaster CR Gold Stainless	Y	N/A
Sealmaster PN Gold Stainless	Y	Y*
Sealmaster PN Gold Composite	Y	Y*
Sealmaster Material Handling	Y	Y*

\* Bolt on caps for mounted ball bearings are for flange housing designs only.  
 Caps fit on housings that have been modified with the appropriate bolt pattern as defined by the prefix "B" in the part number.  
 Example: Sealmaster PN Gold CRBFTS-PN24, Sealmaster Gold BSFT-24  
 \*Note: Additional end cap designs exist for non-standard parts or industry specific designs. Consult Application Engineering for more information.

Notes: 1. Bolt on caps for mounted ball bearings are for flange housing designs only. Caps fit on housings that have been modified with the appropriate bolt pattern as defined by the prefix "B" in the part number. Example: Sealmaster PN Gold CRBFTS-PN24, Sealmaster Gold BSFT-24  
 2. Ends caps may reduce bearing misalignment capability.

## Backside Shield

Backside shield gaskets are mounted between the bearing and the equipment frame to reduce moisture runoff. Backside shields are available for two and four bolt flange mounted ball bearings.

Backside shields are made of nitrile rubber gaskets to reduce bearing moisture contact mated to a 304 stainless steel plate for improved assembly strength, with drain slots to reduce moisture buildup against the back of the bearing housing.

# Sealmaster GoldPlex®-HP Grease

Formulated by Sealmaster engineers in conjunction with leading lubrication experts, GoldPlex-HP high performance mounted bearing grease is specifically designed to help maximize the operating performance of Sealmaster brand ball and roller bearings. This superior lubricant is formulated with a highly compatible lithium complex thickener and specially processed base oil. A finely tuned additive package further improves performance by providing high film strength, extreme pressure (EP), and anti-wear properties.

Sealmaster GoldPlex-HP provides effective lubrication over a wide range of temperatures with a low temperature performance of -40°F (-40°C). Test results show that GoldPlex-HP outperforms standard bearing greases in oxidation prevention and load carrying capabilities, which contribute to longer bearing life.

This lubricant's performance advantages include:

- Superior corrosion resistance
- Wide operating temperature range (-40°F to 350°F)
- Significantly lowers bearing running temperature
- Increased EP protection
- Lengthens lubrication cycles in most applications
- Excellent consistency

## Availability

GoldPlex HP 14 oz.
GoldPlex HP 35 lb Pail
GoldPlex HP 120 lb Keg
GoldPlex HP 400 lb Drum

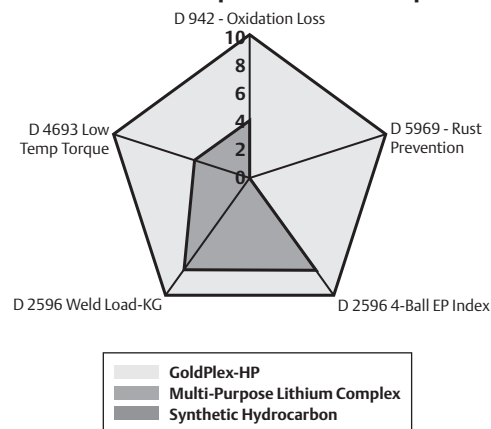

GoldPlex-HP sets a new standard for extreme pressure protection, long life and dependable performance.

## Product Specifications

Thickener Type	Lithium Complex
Texture	Smooth
Color	Gold
60-Stroke Penetration, ASTM D 217, 77F	280-300
Droppino Point, ASTM D 2265, F (C)	500 (260)
Oxidation Stability, ASTM D 942, Psi Drop/100	5
Rust and Corrosion Protection, ASTM D 1743	Pass
Modified with 5% Synthetic Seawater	Pass
Water Washout, ASTM D 1264, 175F, %	5
Timken* OK Load, ASTM D 2509	50
4-Ball EP, ASTM D 2596 Weld Pt. kg	250
4-Ball Wear, ASTM D 2266, Scar Dia. Mm, 40 kg	0.60
Oil Separation, ASTM D 1742, Mass %	10
Base Oil Viscosity SUS @ 100F	575-675
Base Oil Viscosity cSt @ 100C	12.2
Base Oil Viscosity cSt @ 40C	115
NLGI #	2
Operating Temperature Range	-40°F to 350°F

# Sealmaster GoldPlex® -FG Food Grade Grease

GoldPlex-FG food grade, mounted bearing grease is suitable for mounted bearing lubrication where incidental contact with food products may occur or any applications where clean, routine lubrication is required.

This lubricant's performance advantages include:

- Superior corrosion resistance
- Excellent water washout properties
- Compatible with major thickeners
  - Aluminum Complex
  - Calcium Complex
  - Polyurea
- USDA H1 category approved
- Superior dropping point 572°F (300°C)
- Nonstaining and nontoxic

All Sealmaster PN Gold and RPB-CR bearings are factory filled with GoldPlex-FG lubricant.

## Availability

GoldPlex FG 14 oz.
GoldPlex FG 35 lb Pail
GoldPlex FG 120 lb Keg

GoldPlex-FG: Indicates food grade mounted bearing grease for use in a wide variety of bearing applications in the food and beverage industries.

## Product Specifications

Note: The top of the grease fitting cap provides space to mark installation date.

# Lubrication Fittings

Lubrication fittings provide a means quickly connecting a hose or grease gun to a bearing for relubrication. They should be permanently installed onto the bearing and can be threaded or driven into a lubrication or oil hole. It is important to select the correct lubrication fitting for the bearing and application. On Sealmaster ball bearings the lubrication fitting also functions as a stop for the lock pin. Caution should be taken when replacing the fitting on these bearings.

# Oil Hole Plugs

Oil hole plugs are used to block lubrication holes when the port is not required for relubrication the bearing. These plugs help retain the grease or oil, and also help prevent contamination from entering the bearing. All McGill Cam Followers are supplied with oil hole plugs for the number of lubrication holes present.

INCH	Description	Part ID	Pack Qty	inch		Type
				Basic Diameter	Basic Length

# ***Aerospace, Specialty and Industry Specific Bearings***

Aerospace and specialty bearings are designed to meet unique aerospace and specialty industrial requirements. With over 75 years of bearing manufacturing experience and over 60 years of aerospace bearing experience, McGill bearings continue to set standards in the bearing world. Today, McGill is a key supplier to many major aerospace OEM's. Likewise, Rollway Bearings have been utilized in various industrial applications for the past century. Rollway has produced specialized bearings for demanding applications in a wide variety of industries.

## World Class Quality

We can manufacture to meet a variety of specialty process and quality requirements. Our manufacturing facility has achieved Nadcap accreditation for our heat treating, chemical processing and nondestructive testing as well as AS9100 certification. To improve lead time and control quality, the majority of our heat treatment is done in our facility.

## Integrated Engineering and Design Support from Start to Finish.

Our engineers and creative teams will work closely with you during every stage of the process to apply, design, engineer, and manufacture your highly customized bearings. McGill engineers run a comprehensive testing laboratory. Here our engineering teams perform virtual and physical testing. We are able to simulate a variety of aerospace applications, such as oil-out transmission conditions, de-icing chemical exposure and accelerated-life testing. McGill engineers also test and analyze the interaction of lubrication, surface finishes and contamination. We will help save you time and money if you involve our highly qualified engineers as early as possible in the design formation stage.

### Bearing Types

- Cylindrical Roller
- Needle Roller
- Spherical Roller
- Precision Rollers
- Angular Contact, Gothic Arch & Radial Ball
- Aircraft Cam Followers & Track Rollers

### Size and Precision

- Size Offering  
12 - 300 mm O.D.  
6 - 250 mm I.D.
- Roller Bearing Precision  
RBEC 1,3,5
- Ball Precision  
ABEC 1,3,5

### Variety of Capabilities

- Flange Outer
- Gothic Arch
- Notches / Slots
- Riveted Retainers
- Multiple External Tabs
- Straight or Tapered Bore
- Geared Outer

### Materials

- Standard Bearing Quality
- Specialty Steels  
High Temperature  
Corrosion Resistant

## Applications

- Helicopter
  - Main gearboxes
  - Intermediate and tail-rotor gearboxes
  - Main rotors and tail-rotor
- Fixed-wing aircraft
  - Flaps and slats
  - Door mechanisms
- Other aerospace and military
  - Starters
  - Hydraulic systems
  - Control mechanisms
  - Weapons
  - Aircraft Carriers
  - Ground Vehicles
- Industrial
  - Rolling Mill equipment
  - Plastics and rubber extrusion equipment
  - Mining and construction equipment
  - Petrochemical processing equipment
  - Oil Field Equipment
  - Pumps and compressors
  - Material Handling
  - Can-making equipment
  - Medium to high speed gear boxes
  - Turbo machinery
  - Printing equipment
  - Paper converting equipment
  - Precision positioning equipment

Specifically for the commercial-passenger-jet industry, McGill has developed custom bearing solutions that include ball and roller bearings used for aircraft auxiliary pumps; thin-section, corrosion-resistant ball bearings in aircraft-control applications; and track rollers for flap and slat applications.

Within the helicopter industry, McGill has worked with customers to optimize load capability and weight for their specific applications. For instance, McGill has developed spherical roller planetary bearings for helicopter transmissions, and ball and roller bearings with different integral antirotation devices, such as flanges, slots and tabs.

McGill has produced a variety of specialty bearings for industrial applications as well as aerospace. Products range from modifications of standard industrial parts to completely new designs to fit specific applications. Common special features include extra precision, unique geometries and/or specialty materials.

## Rollway Bearings for the Oil Field

Rollway Bearings has been a reliable component in the oil field industry for the past few decades. We have the unique capability to provide a wide variety of bearings ranging from large bore cylindrical radial bearings, tapered thrust bearings, complimented by McGill precision bearings for your replacement and re-build needs.

We manufacture a variety of styles of bearings for the following oil field applications:

- Mud pumps
- Top drives
- Crane hooks
- Swivels
- Draw works
- Frac pumps
- Cranes
- Winches

These are only a portion of the Oilfield applications we regularly provide bearings for.

## Rollway Wheel Bearings for Off-Highway Vehicle Electric Wheels

### GE\* Motorized Wheels used In

- Unit Rig Trucks
- Liebherr\* / Wiseda\* Trucks
- Euclid\* / Hitachi\* Trucks
- Komatsu\* Trucks

Rollway is committed to providing value to the mining industry by manufacturing the best value cylindrical roller bearings available. Whether you're looking to replace an armature bearing as a result of an inspection or all the motor bearings for a rebuild, Rollway is there providing high quality bearings, when you need them. The combination of reliable performance and availability will help your trucks maintain more "Uptime" which translates to more loads per day.

Rollway Number	GE Wheel Number GE Wheel Number	GE Part Number	Location
U-2934-LP-033	772	8864951P180	Planetary Gear

All sales are made on our STANDARD TERMS AND CONDITIONS OF SALE in effect at the time a customer's order is accepted. The current Terms and Conditions are set forth below:

## STANDARD TERMS AND CONDITIONS OF SALE (February 2015)

These Terms and Conditions, the attendant quotation or acknowledgment and all documents incorporated by specific reference therein, will be the complete and exclusive statement of the terms of the agreement governing the sale of goods ("Goods") by Regal Beloit America Inc. and its divisions and subsidiaries ("Seller") to Customer ("Buyer"). Buyer's acceptance of the Goods will manifest Buyer's assent to these Terms and Conditions. If these Terms and Conditions differ in any way from the terms and conditions of Buyer's order, or other documentation, this document will be construed as a counteroffer and will not be deemed an acceptance of Buyer's terms and conditions which conflict herewith.

1. **PRICES:** Unless otherwise specified in writing by Seller, Seller's price for the goods shall remain in effect for thirty (30) days after the date of Seller's quotation or acknowledgment of Buyer's order for the Goods, whichever occurs first, provided an unconditional, complete authorization for the immediate shipment of the Goods is received and accepted by Seller within such time period. If such authorization is not received by Seller within such thirty (30) day period, Seller shall have the right to change the price for the Good to Seller's price for the Goods at the time of shipment.

2. **TAXES:** Any tax or governmental charge or increase in same hereafter becoming effective increasing the cost to Seller of producing, selling or delivering the Goods/provision of Services or of procuring material used therein, and any tax now in effect or increase in same payable by the Seller because of the manufacture, sale or delivery of the Goods/provision of Services, may at Seller's option, be added to the price.

3. **TERMS OF PAYMENT:** Subject to the approval of Seller's Credit Department, terms are net thirty (30) days from date of Seller's invoice in U.S. currency. If any payment owed to Seller is not paid when due, it shall bear interest, at a rate to be determined by Seller, which shall not exceed the maximum rate permitted by law, from the date on which it is due until it is paid. Seller shall have the right, among other remedies, either to terminate the Agreement or to suspend further performance under this and/or other agreements with Buyer in the event Buyer fails to make any payment when due. Buyer shall be liable for all expenses, including attorneys' fees, relating to the collection of past due amounts.

4. **SHIPMENT AND DELIVERY:** Shipments are made F.O.B. Seller's shipping point. Any claims for shortages or damages suffered in transit shall be submitted by the Buyer directly to the carrier. While Seller will use all reasonable commercial efforts to maintain the delivery date for the Goods or the date of provision of Services acknowledged or quoted by Seller, all such dates are approximate. Seller reserves the right to make partial shipments and to segregate "specials" and made-to-order Goods from normal stock Goods. Seller shall not be bound to tender delivery of any Goods for which Buyer has not provided shipping instructions.

5. **QUANTITY:** Buyer agrees to accept overruns of up to ten percent (10%) of the order on "made-to-order" Goods, including parts. Any such additional items shall be priced at the price per item charged for the specific quantity ordered.

6. **LIMITED WARRANTY:** Subject to the limitations of Section 7, Seller warrants that the Goods will be free from defects in material and workmanship under normal use, service and maintenance and Services will be performed by trained personnel using proper equipment and instrumentation for the particular Service provided. Any licensed firmware embodied in the Goods will execute the programming instructions provided by Seller. The foregoing warranties will apply until the expiration of the applicable warranty period. Except as specified below, Goods are warranted for twelve (12) months (unless otherwise specified by Seller in writing) from the date of shipment of the Goods by Seller. Consumables and Services (except as specified below) are warranted for a period of 90 days from the date of shipment or completion of the Services. Products purchased by Seller from a third party for resale to Buyer ("Resale Products") shall carry only the warranty extended by the original manufacturer. Buyer agrees that Seller has no liability for Resale Products beyond making a reasonable commercial effort to arrange for procurement and shipping of the Resale Products. **THIS IS THE SOLE AND EXCLUSIVE WARRANTY GIVEN BY SELLER WITH RESPECT TO THE GOODS/SERVICES AND IS IN LIEU OF AND EXCLUDES ALL OTHER WARRANTIES, EXPRESS OR IMPLIED, ARISING BY OPERATION OF LAW OR OTHERWISE, INCLUDING WITHOUT LIMITATION, MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE WHETHER OR NOT THE PURPOSE OR USE HAS BEEN DISCLOSED TO SELLER IN SPECIFICATIONS, DRAWINGS OR OTHERWISE, AND WHETHER OR NOT SELLER'S PRODUCTS ARE SPECIFICALLY DESIGNED AND/OR MANUFACTURED BY SELLER FOR BUYER'S USE OR PURPOSE.**

This warranty does not extend to any losses or damages due to misuse, accident, abuse, neglect, normal wear and tear, unauthorized modification or alteration, use beyond rated capacity, or improper installation, maintenance or application. To the extent that Buyer or its agents has supplied specifications, information, representation of operating conditions or other data to Seller in the selection or design of the Goods or provision of Services and the preparation of Seller's quotation, and in the event that actual operating conditions or other conditions differ from those represented by Buyer, any warranties or other provisions contained herein which are affected by such conditions shall be null and void. If within thirty (30) days after Buyer's discovery of any warranty defects within the warranty period, Buyer notifies Seller thereof in writing, Seller shall, at its option, repair, correct, or replace F.O.B. point of manufacture, or refund the purchase price for, that portion of the goods found by Seller to be defective. Failure by Buyer to give such written notice within the applicable time period shall be deemed an absolute and unconditional waiver of Buyer's claim for such defects. Goods repaired or replaced during the warranty period shall be covered by the foregoing warranty for the remainder of the original warranty period or ninety (90) days, whichever is longer. Buyer assumes all other responsibility for any loss, damage, or injury to persons or property arising out of, connected with, or resulting from the use of Goods, either alone or in combination with other products/components.

**SECTIONS 6 AND 7 APPLY TO ANY ENTITY OR PERSON WHO MAY BUY, ACQUIRE OR USE SELLER'S GOODS, INCLUDING ANY ENTITY OR PERSON WHO BUYS THE GOODS FROM SELLER'S DISTRIBUTOR AND SUCH ENTITY OR PERSON SHALL BE BOUND BY THE LIMITATIONS THEREIN.**

7. **LIMITATION OF REMEDY AND LIABILITY:** **THE SOLE AND EXCLUSIVE REMEDY FOR BREACH OF ANY WARRANTY HEREUNDER (OTHER THAN THE WARRANTY PROVIDED UNDER SECTION 13) SHALL BE LIMITED TO REPAIR, CORRECTION, REPLACEMENT, OR REFUND OF THE PURCHASE PRICE UNDER SECTION 6. SELLER SHALL NOT BE LIABLE FOR DAMAGES CAUSED BY DELAY IN PERFORMANCE AND IN NO EVENT, REGARDLESS OF THE FORM OF THE CLAIM OR CAUSE OF ACTION (WHETHER BASED IN CONTRACT, INFRINGEMENT, NEGLIGENCE, STRICT LIABILITY, OTHER TORT OR OTHERWISE), SHALL SELLER'S LIABILITY TO BUYER AND/OR ITS CUSTOMERS EXCEED THE PRICE TO BUYER OF THE SPECIFIC GOODS OR SERVICES PROVIDED BY SELLER GIVING RISE TO THE CLAIM OR CAUSE OF ACTION. BUYER AGREES THAT IN NO EVENT SHALL SELLER'S LIABILITY TO BUYER AND/OR ITS CUSTOMERS EXTEND TO INCLUDE INCIDENTAL, CONSEQUENTIAL OR PUNITIVE DAMAGES. THE TERM "CONSEQUENTIAL DAMAGES" SHALL INCLUDE, BUT NOT BE LIMITED TO, LOSS OF ANTICIPATED PROFITS, LOSS OF USE, LOSS OF REVENUE, COST OF CAPITAL AND DAMAGE OR LOSS OF OTHER PROPERTY OR EQUIPMENT AND COSTS INCURRED INCLUDING WITHOUT LIMITATION FOR CAPITAL, FUEL AND POWER, AND CLAIMS OF BUYER'S CUSTOMERS. GOODS AND/OR SERVICES SOLD HEREUNDER ARE NOT FOR USE IN ANY NUCLEAR AND RELATED APPLICATIONS.** Buyer accepts goods and/or services with the foregoing understanding, agrees to communicate the same in writing to any subsequent purchaser or users and to defend, indemnify and hold harmless Seller from any claims, losses, suits, judgments and damages, including incidental and consequential damages, arising from such use, whether the cause of action be based in tort, contract or otherwise, including allegations that the Seller's liability is based on negligence or strict liability.

8. **BUYER RESPONSIBILITIES:** Buyer shall provide Seller ready access to the site where services are to be performed and adequate workspace and facilities to perform same as provided in these terms and conditions. Buyer shall not require Seller or its employees, as a condition to site access or otherwise, to further agree or enter into any agreement, which waives, releases, indemnifies or otherwise limits or expands any rights or obligations whatsoever. Any such agreements shall be null and void. Buyer shall inform Seller, in writing, at the time of order placement, of any known hazardous substance or condition at the site, including, but not limited to, the presence of asbestos or asbestos containing materials, and shall provide Seller with any applicable Material Data Safety Sheets regarding same. Buyer shall appoint a representative familiar with the site and the nature of the services to be performed by Seller to be present at all times that Seller personnel are at the site. Seller shall not be liable for any expenses incurred

by Buyer in removing, replacing or refurbishing any Buyer equipment or any part of Buyer's building structure that restricts Seller access. Buyer personnel shall cooperate with and provide all necessary assistance to Seller. Seller shall not be liable or responsible for any work performed by Buyer.

9. **BUYER SUPPLIED DATA:** To the extent that Seller has relied upon any data or information supplied by Buyer to Seller ("Data") in the selection or design of the Goods and/or provision of the Services and the preparation of Seller's quotation, and the Data is inadequate or inaccurate, any warranties or other provisions contained herein which are affected by such conditions shall be null and void.

10. **TECHNICAL ADVICE:** It is expressly understood that the Seller assumes no obligation or liability for any technical advice given without charge and furnished by the Seller with respect to the use of the Goods. All such technical advice, or results obtained, is given and accepted at Buyer's risk.

11. **EXCUSE OF PERFORMANCE:** Seller shall not be liable for delays in performance or for non-performance due to acts of God, acts of Buyer, war, riot, fire, flood, other severe weather, sabotage, or epidemics; strikes or labor disturbances; governmental requests, restrictions, laws, regulations, orders or actions; unavailability of or delays in transportation; default of suppliers; or unforeseen circumstances or any events or causes beyond Seller's reasonable control. Deliveries of Goods or provision of Services may be suspended for an appropriate period of time as a result of the foregoing. If Seller determines that its ability to supply the total demand for the Goods, or to obtain material used directly or indirectly in the manufacture of the Goods, is hindered, limited or made impracticable due to causes addressed in this Section 8, Seller may allocate its available supply of the Goods or such material (without obligation to acquire other supplies of any such Goods or material) among itself and its purchasers on such basis as Seller determines to be equitable without liability for any failure of performance which may result there from. Deliveries suspended or not made by reason of this section may be canceled by Seller upon notice to Buyer without liability, but the balance of the agreement shall otherwise remain unaffected.

12. **CANCELLATIONS AND DELAYS:** The Buyer may cancel orders only upon written notice and upon payment to Seller of cancellation charges which include, among other things, all costs and expenses incurred and commitments made by the Seller and a reasonable profit thereon. Any request by Buyer to extend the delivery schedule must be agreed to in writing by the Seller. If agreement cannot be reached, Seller may deliver product or provide services to the last known ship to address and invoice the Buyer upon completion of the product or services or prior delivery date, whichever is later.

13. **CHANGES:** Buyer may request changes or additions to the Goods/Services consistent with Seller's specifications and criteria. In the event such changes or additions are accepted by Seller, Seller may revise the price and delivery schedule. Seller reserves the right to change designs and specifications for the Goods or Services without prior notice to Buyer, except with respect to Goods being made-to-order for Buyer. Seller may cancel any order or terminate any agreement without liability to Buyer if Buyer fails to meet the conditions specified herein.

14. **TOOLING:** Tool, die, and pattern charges, if any, are in addition to the price of the Goods/Services and are due and payable upon completion of the tooling. All such tools, dies and patterns shall be and remain the property of Seller. Charges for tools, dies, and patterns do not convey to Buyer, title, ownership interests in, or rights to possession or removal, nor prevent their use by Seller for other purchasers, except as otherwise expressly provided by Seller and Buyer in writing with reference to this provision.

15. **SOFTWARE AND FIRMWARE:** Notwithstanding any other provision herein to the contrary, Seller or applicable third party owner shall retain all rights of ownership and title in its respective firmware and software, including all copyrights relating to such firmware and software and all copies of such firmware and software. Except as otherwise provided herein, Buyer is hereby granted a nonexclusive, royalty free license to use firmware and software, and copies of firmware and software, incorporated into the Goods only in conjunction with such Goods and only at the Buyer's plant site where the Goods are first used. Buyer's use of certain firmware (as specified by Seller) and all other software shall be governed exclusively by Seller's and/or third party owner's applicable license terms.

16. **ASSIGNMENT:** Buyer shall not assign its rights or delegate its duties hereunder or any interest therein or any rights hereunder without the prior written consent of the Seller, and any such assignment, without such consent, shall be void.

17. **PATENTS AND COPYRIGHTS:** Subject to Section 7, Seller warrants that the Goods and/or Services sold, except as are made specifically for Buyer according to Buyer's specifications, do not infringe any valid U.S. patent or copyright in existence as of the date of delivery. This warranty is given upon the condition that Buyer promptly notify Seller of any claim or suit involving Buyer in which such infringement is alleged, and, that Buyer cooperate fully with Seller and permit Seller to control completely the defense or compromise of any such allegation of infringement. Seller's warranty as to use only applies to infringements arising solely out of the inherent operation (i) of such Goods, or (ii) of any combination of Goods in a system designed by Seller. In the event such Goods and/or Services, singularly or in combination, are held to infringe a U.S. patent or copyright in such suit, and the use of such Goods and/or Services is enjoined, or in the case of a compromise by Seller, Seller shall have the right, at its option and expense, to procure for Buyer the right to continue using such Goods or providing such Services, or replace them with non-infringing Goods or Services; or modify same to become non-infringing; or grant Buyer a credit for the depreciated value of such Goods and accept return of them or grant Buyer a credit for such provided Services.

18. **EXPORT/IMPORT:** Buyer agrees that all applicable import and export control laws, regulations, orders, and requirements, including without limitation those of the United States and the European Union, and the jurisdictions in which the Seller and the Buyer are established or from which Goods may be supplied, will apply to their receipt and use. In no event shall Buyer use, transfer, release, import, or export Goods in violation of such applicable laws, regulations, orders or requirements.

19. **HIRING/EMPLOYEES:** Buyer agrees that during the execution of Services by Seller and for a period of twelve (12) months after the performance of Services, it will not hire any employee(s) of Seller and will not entice or counsel any such employee(s) to leave Seller's employ. Buyer agrees that this covenant shall extend to its agents and affiliates. In the event that an employee of Seller is hired or leaves the employ of Seller in such circumstances, Buyer shall pay Seller, as compensation for the cost incurred by Seller in recruiting and training the employee, the sum equivalent to six (6) months pay for each employee hired from or leaving the employment of Seller.

20. **EMPLOYEE SAFETY AND SUSPENSION OF SERVICES:** Seller may suspend or terminate Services, at its sole discretion, without liability to Buyer if Buyer fails to meet its obligations hereunder or becomes bankrupt or insolvent or if Seller determines that continuing to provide Services represents a hazardous condition for its employees.

21. **MISCELLANEOUS:** These terms and conditions set forth the entire understanding and agreement between Seller and Buyer, and supersede all other communications, negotiations and prior oral or written statements regarding the subject matter of these terms and conditions. No change, modification, rescission, discharge, abandonment, or waiver of these terms and conditions of Sale shall be binding upon the Seller unless made in writing and signed on its behalf by an officer of the Seller. No conditions, usage or trade, course of dealing or performance, understanding or agreement purporting to modify, vary, explain, or supplement these Terms and Conditions shall be binding unless hereafter made in writing and signed by the party to be bound, and no modification shall be affected by the acceptance of purchase orders or shipping instruction forms containing terms at variance with or in addition to those set forth herein. Any such modifications or additional terms are specifically rejected by Seller. No waiver by Seller with respect to any breach or default or any right or remedy and no course of dealing, shall be deemed to constitute a continuing waiver of any other breach or default or of any other right or remedy, unless such waiver be expressed in writing and signed by the party to be bound. Seller is not responsible for typographical or clerical errors made in any quotation, orders or publications. All such errors are subject to correction. The validity, performance, and all other matters relating to the interpretation and effect of this contract shall be governed by the law of the state of New York. The United Nations Convention on the International Sale of Goods shall not apply to any transaction hereunder.

**APPLICATION CONSIDERATIONS**

The proper selection and application of power transmission products and components, including the related area of product safety, is the responsibility of the customer. Operating and performance requirements and potential associated issues will vary appreciably depending upon the use and application of such products and components. The scope of the technical and application information included in this publication is necessarily limited. Unusual operating environments and conditions, lubrication requirements, loading supports, and other factors can materially affect the application and operating results of the products and components and the customer should carefully review its requirements. Any technical advice or review furnished by Regal Beloit America, Inc. and its affiliates with respect to the use of products and components is given in good faith and without charge, and Regal assumes no obligation or liability for the advice given, or results obtained, all such advice and review being given and accepted at customer's risk.

For a copy of our Standard Terms and Conditions of Sale, Disclaimers of Warranty, Limitation of Liability and Remedy, please contact Customer Service at 1-800-626-2120. These terms and conditions of sale, disclaimers and limitations of liability apply to any person who may buy, acquire or use a Regal Beloit America Inc. product referred to herein, including any person who buys from a licensed distributor of these branded products.
