THE SNFA GROUP

Since 1952, the SNFA Group has distinguished itself in the market of high performance ball and roller bearings and has gradually implemented an organizational structure specializing in:

- Special ball and roller bearings for the aerospace and related industries;
- High-precision angular contact ball bearings for machine tools and similar applications.

Over the years, the high level of expertise in these two fields has allowed the development of often unique technologies for the design and manufacture of bearings to the highest quality.

In Italy, the SNFA Group is represented by Somecat S.p.A., who, along with its sister company in the UK, SNFA Bearings Ltd., is a leading manufacturer of super precision angular contact bearings primarily for machine tools.

The Technology. . .

State-of-the-art technology and constant upgrading is applied throughout the SNFA Group.

Each process, from design to testing, from manufacturing to inspection, is within a procedure that benefits from the necessary resources and facilities.

Grinding and superfinishing are part of a complex cycle of operations involving all the surfaces of the bearing rings and these operations require the use of special high-quality CNC machinery. For this reason, a new area within the Somecat facility was developed using state-of-the-art technologies.

Rings are manufactured from bar, tube or forging. The most common raw material used is 100Cr6 that must be of the highest quality and inclusion free.

Matching is the operation whereby two or more bearings are brought together for preloading into sets.

In order to obtain a precise preloading, SNFA uses specialized equipment and the whole process is strictly controlled.

Cotton fabric reinforced phenolic resin cages are machined from tube. Good dynamic behaviour of this vital bearing component depends on raw material homogeneity and precise geometry being obtained during manufacture.

Final inspection of rings is performed under environmentally controlled conditions using specialized equipment that simultaneously measures all geometric parameters.

Marking ensures complete identification of the product.

Product design, from analysis computer programs through to laboratory testing, is performed in line with criteria conforming to ISO 9000 standards.

Functional tests are carried out in the SNFA laboratories and are targeted at finding new and innovative solutions for the benefit of our customers.

SNFA already offers its customers the technology for optimizing the choice of bearings during the design stage of a new application.

Recently SNFA has developed a new program, SECBA, that analyzes bearing performance by taking into account the whole of the spindle assembly.

The Quality System

All of SNFA production is under quality management systems audited and approved to ISO 9001:2000 standards that encompass safety, environment, human resource and continuous improvement strategies. This striving for excellence by Somecat and SNFA Bearings Ltd. testifies that Total Quality is the main feature of the companies' production activities.

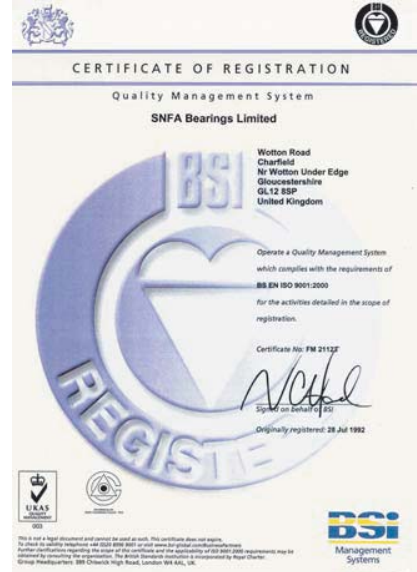

CERTIFICATE

IoNet and its partner CISQ/ICIM hereby certify that the organization **SOMECAT S.p.A.** Via Savonera Druento, 15 I-10044 PIANEZZA (TO) for the following field of activities **Design and production of high precision ball bearings.** has implemented and maintains a **Quality Management System** which fulfills the requirements of the following standard **ISO 9001** Issued on: 2001-12-12 Validity date: 2004-12-11 Registration Number: IT-3910

IoNet partners: SENOR, Spain; AFAD, France; ABB, Belgium; International, Belgium; AFPCR, Portugal; CISQ, Italy; CQC, China; CEIM, China; CCR, Czech Republic; DQS, Germany; IIR, Denmark; IUT, Germany; PCAV, Brazil; FOUNGONGBA, Hong Kong; INELSA, Hong Kong; IONTEC, Colombia; SISA, Argentina; ICA, Spain; SISA, Argentina; SIO, Korea; MSST, Germany; MCS, Slovenia; SQA, Ireland; QCR, Austria; PCSC, Finland; PBR, Singapore; SPS, Finland; SII, Israel; SIO, Slovenia; SQA, Switzerland; IQNet is represented in the CISQ by the following partners: AFAG, ABB, Belgium; International, CISQ, DQS, Korea and PCSC.

*The list of IoNet partners is valid at the time of issue of this certificate. Updated information is available under www.ioqnet.com

CHROMEX®40

This special highly-alloyed steel, resulting from the most advanced aeronautical and aerospace technologies, now also allows for the production of precision bearings for machine tools. Its innovative composition, with elements such as molybdenum, chromium, vanadium and nitrogen, allows for a more homogeneous structure and increases its resistance to fatigue and corrosion.

Chromex®40 is the most reliable, stable and innovative solution for high performance of bearings in machine tools and electrospindles.

- 100Cr6 = L_{10h}
- 100Cr6 + NS = $L_{10h} \times 2$
- Chromex® 40 + NS = $L_{10h} \times 5$

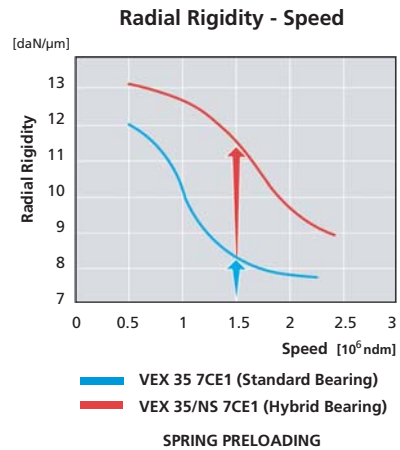

Centrifugal Force

Ceramic Material

Ceramic material balls are essential components of bearings for high-speed applications, as they represent a perfect combination in terms of density, resistance and life. Thanks to the low density of the ceramic material, 40% of that of steel, the balls develop lower centrifugal forces that result in reduced contact friction thus enabling higher speed and durability.

Material Characteristics Data

				SILICON NITRIDE	BEARING STEEL
Density	ρ	[g/cm ³]	--	3.19	7.80

Corrosion Resistance	--	--	--	good	bad
Magnetism	--	--	--	absent	present
Electrical Insulation	--	--	--	good	bad

Friction due to rolling elements in hybrid bearings is lower than in steel ball bearings. Therefore hybrid bearings need a smaller quantity of oil for lubrication. These favourable characteristics result in a significant reduction of absorbed power.

**VEB and VEX Bearings For High Speed
In "H1" and "G1" Air-Oil Lubrication**

High-speed operation requires efficient lubrication to ensure the presence of oil in the critical areas of the bearing, namely contact between raceway and rolling elements.

In these areas, because of high pressures and sliding effects, it is necessary to guarantee the separation of contacting surfaces by an oil film. The most traditional solution, the injection of the oil or of air-oil from nozzles, can result in lubricant dispersion due to the effects of wind at high rotational speeds (Fig. 1).

The opportunity to run the air-oil flow directly into the bearing by means of radial holes in the outer rings becomes beneficial.

VEB and VEX bearings, predisposed for this solution, take the "H1" (Fig. 2) or "G1" (Fig. 3) codes in their designation. The radial oil-feed holes and o-rings in the outer ring serve to:

- facilitate the design of oil supply circulation in the spindle body;
- inject the lubricating flow directly at the high pressure points of contact;
- keep the cage location lubricated;
- minimize pressure losses of the air-oil flow.

Sealed Bearings

Sealed bearings produced by SNFA offer several advantages in terms of reliability and safety. Seals protect the bearing from the infiltration of contaminants and from lubricant deterioration.

Furthermore, the existing space between the cage and the seals creates a reservoir of grease that ensures high performance and a longer working life.

The SNFA sealed bearing production is currently the ISO 10 and ISO 19 series.

Sealed Bearings (Continued)

The main causes reducing the actual working life of bearings are owing to:

- bearing contamination with particles from washing;
- residual moisture;
- lubricant contamination;
- use of lubricants that are unsuitable for the operating conditions, or the properties of which have deteriorated;
- lubricant removal and deterioration by the air flow from blown seals during operation.

The series that SNFA is currently producing are the most suitable versions for high rotational speed. This is the operational area in which it is most important to ensure that there are no contaminants inside the bearing, and that the correct type and quantity of grease are used.

Seals have been designed purposely to optimize the inner dimensions of the bearing and so maintain operational reliability.

SNFA Product Range and Interchange Table

SERIES (SNFA)	ISO	FEATURES
SEA	18	Minimum overall dimensions. Radial-axial load 1 500 000 ndm (oil).
SEB	19	Reduced overall dimensions. Radial-axial load 1 500 000 ndm (oil).
VEB	19	Reduced overall dimensions. Very high speed (over 2 000 000 ndm, oil).
HB	19	Very high speed (> 2 000 000 ndm) with oil direct lubrication through outer ring and O-ring (../GH). Grease lubrication with seals (../S).
EX	10	High load capacity. Radial-axial load 1 500 000 ndm (oil).
VEX	10	Good radial-axial load capacity. Very high speed (over 2 000 000 ndm) with oil direct lubrication. Radial-axial load 1 600 000 ndm with grease lubrication with seals (../S).
HX	10	Very high speed (> 2 000 000 ndm) with oil direct lubrication through outer ring and O-ring (../GH). Grease lubrication with seals (../S).
E 200	02	Very high load capacity. Radial-axial load 1 500 000 ndm (oil).
BS 200	02	High axial rigidity and load capacity. Predominantly axial load.
BS (Special)	--	As BS 200.

Note: Bearings with special precision can be offered on request.

Δd_{mp} = Deviation of the mean bore diameter from the nominal ($\Delta d_{mp} = d_{mp} - d$).

ΔD_{mp} = Deviation of the mean outside diameter from the nominal ($\Delta D_{mp} = D_{mp} - D$).

K_{ia} , K_{ea} = Radial runout of assembled bearing inner ring and assembled bearing outer ring, respectively.

S_{ia} , S_{ea} = Side face runout of assembled bearing inner ring and assembled bearing outer ring, respectively.

S_d = Side face runout with reference to bore (of inner ring).

S_D = Outside inclination variation: variation in inclination of outside cylindrical surface to outer ring side face.

V_{Bs} , V_{Cs} = Ring width variation: difference between the largest and smallest single widths of inner ring and of outer ring, respectively.

ΔB_s , ΔC_s = Deviation of single inner ring width or single outer ring width from nominal ($\Delta B_s = B_s - B$ ecc.).

ΔB_{1s} , ΔC_{1s} = Deviation of single width of inner ring and outer ring, respectively, of a bearing specially manufactured for paired mounting and universal bearing ($\Delta B_{1s} = B_s - B$ ecc.).

Grease Quantity

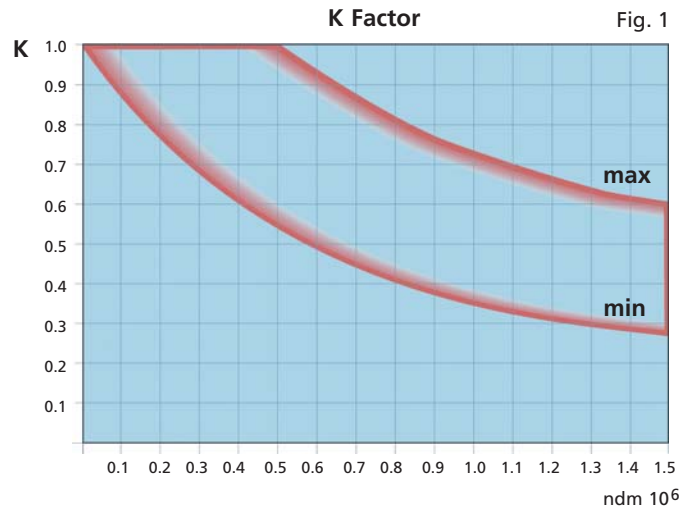

The amount of grease to be introduced into the bearing depends on operating speed.

The amount is calculated by multiplying factor **K**, a function of maximum rotation speed, expressed in "ndm" (Fig. 1) by the "reference quantity" bore and bearing series function as shown in the diagram (Fig. 2).

In the case of small bearings where grease quantities are very small, it is advised that before greasing, the bearings are immersed in a grease solution (containing 3÷5% of grease) then removed and allowed to drain (and the solvent to evaporate) before applying the grease. This ensures that all the bearing surfaces are covered with a thin layer of the lubricant.

Factory - Greased Bearings

SNFA bearings are very often supplied with the type and amount of grease as specified by the customer, both in open and sealed versions (./S), if available.

* Please Note: The bearing's mating parts must allow the excess of grease to move outside.

Bearing Marking - Individual Bearings and Bearing Groups

Bearing designation is placed on the wider face of the outer ring. Complete designation (contact angle, precision, arrangement, type, etc.) of medium - large size bearing sets is marked on one bearing only. The remaining bearings of the group have markings indicating: type, trade mark and country of origin only.

Micron deviations from the nominal value of each bore and outside diameter are marked on that surface, at the point of maximum eccentricity (maximum radial thickness).

Maximum assembly concentricity is obtained by locating this point at 180° to maximum shaft or housing eccentricity. Other markings that may appear on ring faces are manufacturing references (manufacturing date, serial number, etc.).

*** Please Note:** The "V" arrow on the bearing outer diameter indicates the direction of thrust applicable to the inner rings of the bearing group. The arrow is placed at the point of maximum outer ring eccentricity.

Boxes and Packaging

SNFA bearings are normally packaged in individual boxes, even when they belong to a bearing set. In this case, boxes are grouped together. Marking is with labels applied to each of the boxes. The label bears the following information:

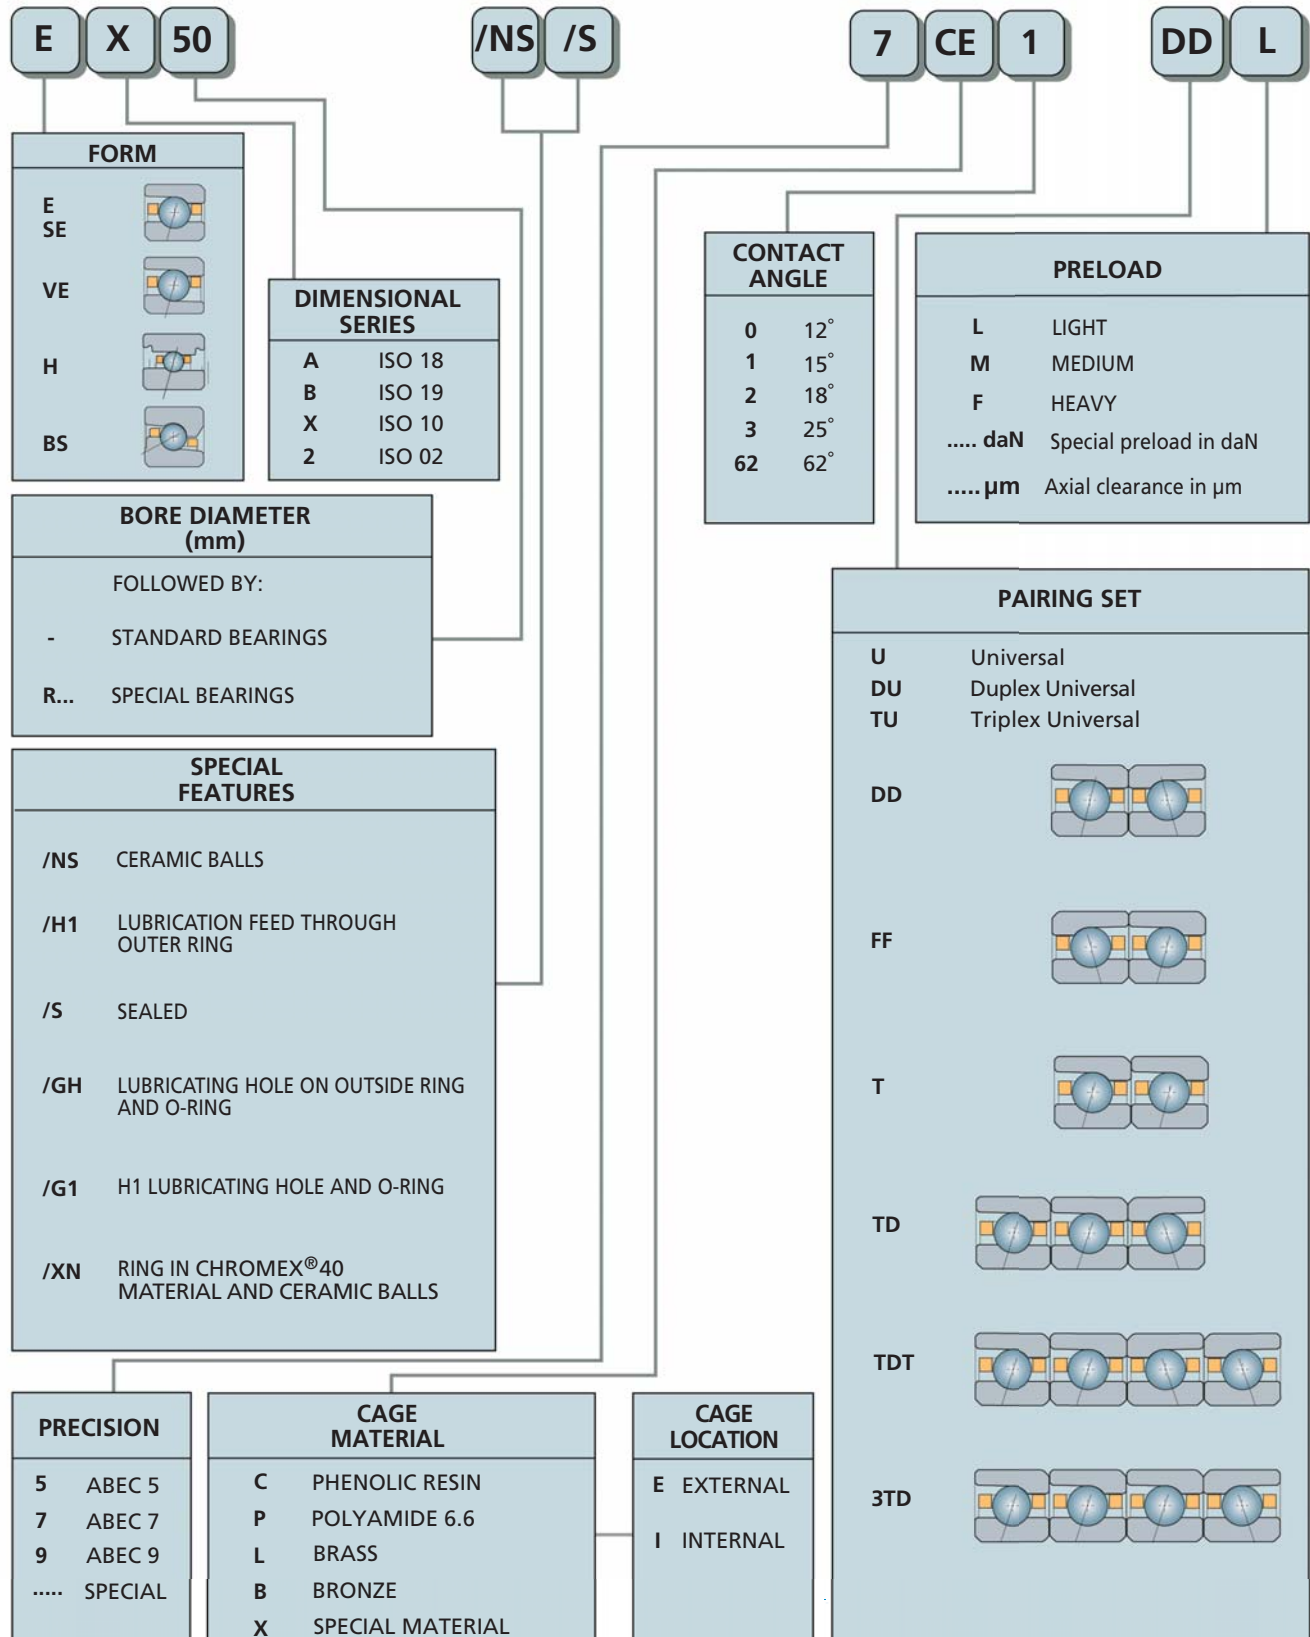

- bearing set designation;
- grease type (for SNFA greased bearings);
- packaging date;
- actual contact angle (for single Universal bearings only).

Boxes are cardboard and are marked with the SNFA trade name and the description "Precision Bearings." The box contains bearing mounting instructions (in four languages).

Bearings with ceramic material balls or with Chromex® 40 rings are contained in boxes bearing a red or yellow colour label with the wording "CERAMIC" or "CHROMEX® 40."
