

TICO Structural Bearings

Tiflex Limited have been manufacturing TICO Structural Bearings for over 50 years.

Our expertise stems from our vast knowledge of vibration analysis and control. Many of the projects which we have been involved in over the last half-decade have required the specification, design and manufacture of bespoke bearings to suit individual unique applications.

No two buildings are the same. No two vibration situations are the same. Tiflex can offer you their services to produce a design of structural bearing, which will work for your individual requirements.

Tiflex also produce a range of standard products. These products are manufactured from a range of different TICO Structural Bearing Materials in sizes designed to suit many applications.

The standard range of products can be supplied with the test data produced in our in-house state of the art laboratory.

NEW to the TICO range, material which when specified correctly, can produce a natural frequency of as low as 8Hz. These Critical Frequency materials are now available from Tiflex in standard or non-standard product sizes.
